Topic Information

Assessment: Take home exam (weighting = $\frac{4}{13}$ of total course mark — *but must do well in all parts of course*).

- Distributed: 11/06/98
- Due: 4:30pm 19/06/98 at CSE office (or postmarked that day)

Questions based on what is *said* in lectures.

Reference text: Philip Straffin, *Game Theory and Strategy*, Volume 36 New Mathematical Library, The Mathematical Association of America, 1993. (ISBN: 0-883850-637-9)

Slides: <http://www.cse.unsw.edu.au/~morri/comp9514/>

Course Outline

- Lecture 1: Introduction to game theory; Two-person zero-sum games
– Dominance/saddle points
- Lecture 2: Two-person zero-sum games (continued)
– Mixed Strategies; Game trees
- Lecture 3: Two-person zero-sum games (conclusion)
– Utility; Games against nature
Two-person nonzero-sum games
– Nash Equilibria
- Lecture 4: Two-person nonzero-sum games (conclusion)
– Prisoner's dilemma; Cooperation
- (Exercises at end of each lecture.)

Slide 3

Game Theory

- Study of how players *should rationally* play games.
- Study traditional games: tic-tac-toe, bridge, poker, ...
- Abstract from and generalise study of these traditional games.
- Applications to: political candidates attempting to win election, company strategies, biological prosperity, ...

Slide 4

What is a Game?

(Straffin 1993) Situation in which we have:

1. At least 2 *Players*
2. Players have a number of courses of action available to them (i.e., *strategies*)
3. Strategies determine *outcome* of game
4. Each outcome has a set of numerical *payoffs* — one to each player in the game

Aim: each player would like an outcome giving them the highest payoff possible.

Elements of conflict and coordination.

Slide 5

What Game Theory is Not!

WARNING! Real-life games are enormously complex and difficult to model.

Aim: Model important features of actual game in hope that we can gain some insight.

WARNING! Real-life players are not always rational!

WARNING! Game theory does not always give unique way to play game.

Slide 6

Two-Person Zero-Sum Games

Slide 7

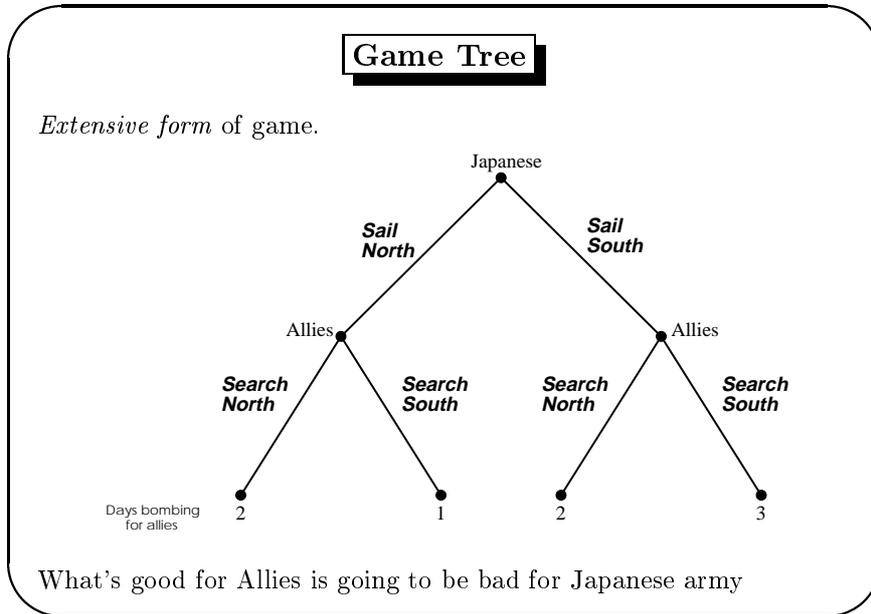

Begin by concentrating on two players.
Each player has a payoff associated with each outcome.
If payoffs add to zero: **Zero-sum game**.
Pure conflict between players.

Let's Play a Game

Slide 8

(Haywood 1954) Battle of the Bismark Sea
1943 Japanese occupying northern New Guinea, Allies south.
Japanese convoy to reinforce troops via two routes:
1. north — rain and bad visibility predicted
2. south — fair weather
Allies send fighter aircraft to damage convoy:
1. north
2. south
Payoff: number of days bombing available

Slide 9

Slide 10

Two-Person Zero-Sum Games

Begin by concentrating on two player games.

Matrix games: Games in which payoffs associated with available strategies can be represented by an $n \times m$ matrix.

Each player has payoff associated with outcome.

		Player 2	
		Sail North	Sail South
Player 1	Search North	(2, -2)	(2, -2)
	Search South	(1, -1)	(3, -3)

Slide 11

Payoffs add to zero. More compact representation:

		Player 2	
		Sail North	Sail South
Player 1	Search North	2	2
	Search South	1	3

Slide 12

Payoff Matrix

Normal form of game.

CONVENTION: Entries represent payoff to row player

		Player 2	
		Sail North	Sail South
Player 1	Search North	2 days	2 days
	Search South	1 day	3 days

Minimax Strategy

Rational decision maker seeks action with best possible payoff in worst-case situation (best payoff assuming opponent makes best counter move).

Slide 13

Let's Play a Game

(Straffin 1993)

		Player 2			
		A	B	C	D
Player 1	A	12	-1	1	0
	B	5	1	7	-20
	C	3	2	4	3
	D	-16	0	0	16

Compare with results on p. 7.

Slide 14

Dominance Principle

Definition: A strategy S *dominates* a strategy T if:

1. every payoff in S is *at least* as good as corresponding payoff in T
2. at least one payoff in S is *strictly* better than corresponding payoff in T .

Idea: *Never* play a dominated strategy.

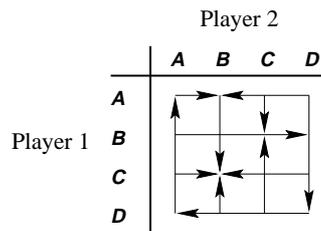

Dominance Principle: Rational player should never choose a dominated strategy.

Good start but does not recommend unique strategy in general.

Equilibrium Outcome

Movement diagram. Draw:

row — arrow from each entry to smallest entry
 column — arrow from each entry to largest entry

Slide 15

Equilibrium pair of strategies represent strategies where a player deciding to unilaterally deviate from this action will worsen their expected outcome.

Saddle Point

Definition: An entry (outcome) is called a *saddle point* in a matrix game if it is less than or equal to any entry in its row and greater than or equal to any entry in its column.

Slide 16

Saddle Point Principle: If matrix game contains a saddle point both players should play strategy that contains it

Definition: In a matrix game, if there is a value v where the row player has a strategy guaranteeing at least v and the column player has a strategy guaranteeing row player no more than v , then v is the *value* of the game.

Slide 17

Finding Saddle Points

Check each point (smallest in row and largest in column)

Alternatively:

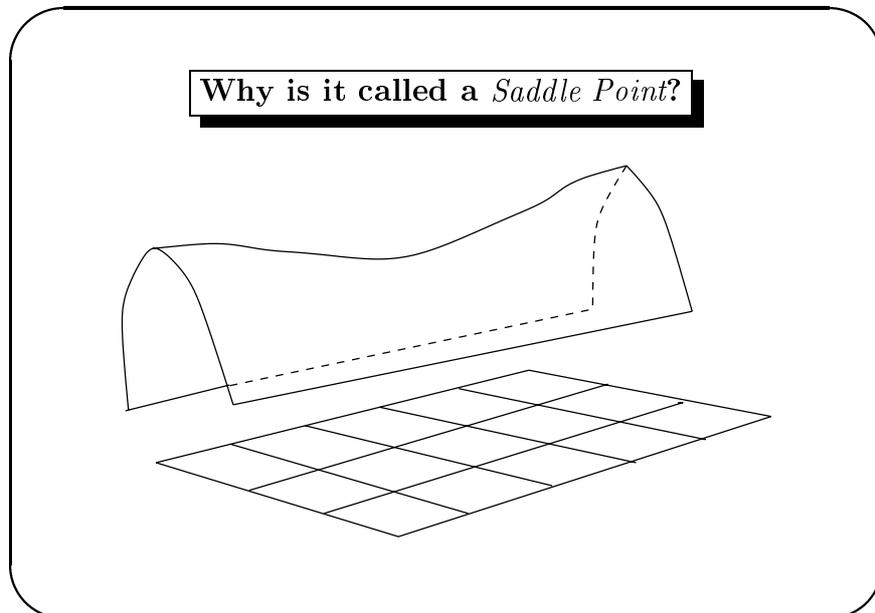

1. determine minimum in each row — circle maximum of these
2. determine maximum in each column — circle minimum

Slide 18

		Player 2				
		A	B	C	D	<i>Row Min</i>
Player 1	A	12	-1	1	0	-1
	B	5	1	7	-20	-20
	C	3	2	4	3	2 ←
	D	-16	0	0	16	-16
<i>Col Max</i>		12	2	7	16	
			↑			

If circled entries coincide, they are saddle points. Otherwise they are not. There may be no saddle points in a game (we look at this situation next week).

Slide 19

Slide 20

Important Fact about Saddle Points

Theorem: Any two saddle points in a matrix game have the same value.

Moreover, if row and column player both play strategies with saddle points, the outcome is always a saddle point.

Reflection on Saddle Points

Slide 21

Decision by two players that neither can *unilaterally* improve upon.

Either player could announce their choice of strategy beforehand and not be worse off!

Solution in *pure strategies*.

PURE STRATEGY — strategy says always to take the same action (otherwise mixed strategy).

Why Study Two-Person Games?

Slide 22

Optimal strategy always exists (zero-sum games — Minimax theorem; nonzero-sum games — Nash's theorem)

Many situations with seemingly more “players” can be reduced to two-person games

Terminology

ZERO-SUM GAME — payoffs add to zero

STRATEGY — course of action

Slide 23

PURE STRATEGY — strategy says to always take same action

MIXED STRATEGY — strategy varies with random factor

SOLUTION — strategy giving best possible payoff (a *regret-free* choice).

MULTISTAGE (ITERATED) GAME — game involving sequence of choices

Exercise 1

(Drescher 1981)

Consider the following matrix game.

Slide 24

		Player 2		
		A	B	C
Player 1	A	1	-3	-2
	B	2	5	4
	C	2	3	2

Check for dominated strategies and saddle points.

Exercise 2

(Straffin 1993)

Consider the following matrix game.

Slide 25

		Player 2			
		A	B	C	D
Player 1	A	4	2	5	2
	B	2	1	-1	-20
	C	3	2	4	2
	D	-16	10	16	1

Check for dominated strategies and saddle points.

Exercise 3

Slide 26

Consider the game *Rock, Scissors, Paper*. Write the matrix for this game. Check for dominated strategies and saddle points.

Exercise 4

(Williams 1954) The Coal Problem

Slide 27

Typically it takes 15 tons of coal to heat a house during winter but it can be as low as 10 tons or as high as 20 tons. The price of coal changes with the weather being \$10, \$15 and \$20 per ton during mild, normal and severe winters. You can buy now at \$10.

What should you do? Buy all or part of supply now?

Exercise 5

(Williams 1954) The Secondhand Car

Slide 28

Two brothers inherit a car worth \$800. They decide to settle ownership by sealed bids. Bids are in hundred-dollar amounts. The higher bidder pays his brother the amount of the bid and gets the car. If bids are equal, ownership is determined by the toss of a coin and no money is exchanged. The first brother has \$500 at his disposal whereas the other has \$800.

Draw the game matrix. Is this a zero-sum game? How should the brothers bid?
