LECTURE 14

Lets continue with linked lists, how exciting...
LAST TIME...

- Linked Lists - creating a list by inserting at the head.
TODAY...

- Linked Lists - traversing a list and inserting at the tail
- Linked Lists - searching for conditions
WHERE IS THE CODE?

Live lecture code can be found here:

HTTPS://CGI.CSE.UNSW.EDU.AU/~CS1511/22T1/LIVE/WEEK07/
A linked list is made up of many nodes. The nodes are linked together (a scavenger hunt of pointers).
A LINKED LIST IS MADE UP OF MANY NODES

THE NODES ARE LINKED TOGETHER (A SCAVENGER HUNT OF POINTERS)

For example a list with 1, 3, 5
How do you think we can move through the list to start at the head and then move to each subsequent node until we get to the end of the list...
HOW CAN WE MOVE THROUGH THIS LIST TO FIND NEXT NODE?

Set your head pointer to the current pointer to keep track of where you are currently located....

```
struct node *current = head
```

![Diagram showing a linked list with nodes and pointers](Image)
HOW CAN WE MOVE THROUGH THIS LIST TO FIND NEXT NODE?

Now how would we move the current along?

```c
current = current->next
```
HOW CAN WE MOVE THROUGH THIS LIST TO FIND NEXT NODE?

Now how would we move the current along?

```c
current = current->next
```
HOW CAN WE MOVE THROUGH THIS LIST TO FIND NEXT NODE?

Now how would we move the current along?

```c
current = current->next
```

When should I be stopping?

```c
while (current != NULL)
```

```
head = 0xB62

0xFF0

0xA44

5

current

NULL

0xB62

0x666

1

0xFF0

0xFF0

3

NULL

5

0xFF0
```
SO
TRAVERSING
A LINKED
LIST...

- The only way we can make our way through the linked list is like a scavenger hunt, we have to follow the links from node to node (sequentially! we can’t skip nodes)
- We have to know where to start, so we need to know the head of the list
- When we reach the NULL pointer, it means we have come to the end of the list.
SO NOW, LET'S PRINT EACH NODE OUT...

```c
void print_list(struct node *head){
    struct node *current = head;
    while (current != NULL){
        printf("%d\n", current->data);
        current = current->next;
    }
}
```
You have five boxes in a row numbered 1 to 5, in one of which, a cat is hiding. Every night he jumps to an adjacent box, and every morning you have one chance to open a box to find him. How do you win this game of hide and seek - what is your strategy? What if there are n boxes?
• Where can I insert in a linked list?
  ○ At the head (last lecture)
  ○ Between any two nodes that exist
  ○ After the tail as the last node
I could have a condition that will help me find at which point to insert (specified by my problem).

In my list, for example, it could be that I want to put a 4 between 3 and 5...

This would involve searching through the list to find 3

- Or if the list is in order, it may be to find the value less than the one I am inserting and the value after to be greater than the value I am inserting and then insert by creating a new node and linking it to the right space...
Find where to insert: Is current less than 5 AND next more than 5?

Set current to the head of the list to begin traversal

```c
struct node *current = head
```

```c
head = 0xB62
```

```
current = head
```

Insert 4 (after 3 and before 5)
LINKED LIST EXAMPLE
INSERTING BETWEEN NODES

INSERT 4 (AFTER 3 AND BEFORE 5)

Find where to insert: Is current less than 5 AND next more than 5?
Traverse list until you find the right node to insert after...

```c
current = current->next
```

```
head = 0xB62
0x666
1
0xFF0
0xB62
3
0xB62
current
5
NULL
```

```
0x666
1
0xFF0
0xB62
3
0xB62
5
NULL
```
Find where to insert: Is current less than 5 AND next more than 5?

```c
current->data < 5 && current->next->data > 5
```

Traverse list until you find the right node to insert after...

```c
current = current->next
```

---

**INSERT 4 (AFTER 3 AND BEFORE 5)**

```
head = 0xB62
0xFF0
0x666
NULL

3
0xB62

5
NULL
```
Link List Example

Inserting Between Nodes

Insert 4 (After 3 and Before 5)

Now that you found location to insert, create the node:

```c
struct node *new_node = malloc(sizeof(struct node));
new_node->data = 4;
new_node->next = NULL;
```
Now insert the node after the current node...

```c
new_node->next = current->next;
current->next = new_node;
```
LINKED LIST EXAMPLE

INSERTING BETWEEN NODES

INSERT 4 (AFTER 3 AND BEFORE 5)

Now let’s insert at the end of the list... let’s insert 10
Set current to the head of the list to begin traversal until the end of the list....

```c
struct node *current = head
```

```
head = 0xB62
current = head
```

```
head = 0xB62
0xFF0
0x666
0x666
```

```
1
0xFF0
0xB62
```

```
3
0xFF0
0xA44
```

```
5
NULL
```

```
NULL
0xFF0
```
LINKED LIST EXAMPLE
INSERTING BETWEEN NODES

INSERT 4 (AFTER 3 AND BEFORE 5)

Moving along the list now - 1st loop

`current = current->next`
LINKED LIST EXAMPLE INSERTING BETWEEN NODES

INSERT 4 (AFTER 3 AND BEFORE 5)

Moving along the list now - 2nd loop

```c
current = current->next
```
Now we want to stop before we get to the NULL, so we want to stop at the last node and not go past it... so stop here and not at NULL

while (current->next != NULL)
Now that we know where to insert, create the node:

```c
struct node *new_node = malloc(sizeof(struct node));
new_node->data = 10;
new_node->next = NULL;
```
LINKED LIST EXAMPLE
INSERTING BETWEEN NODES

INSERT 4 (AFTER 3 AND BEFORE 5)

Now we have a node, connect it...

```c
current->next = new_node;
new_node->next = NULL;
```

```
head = 0xB62
0x666

current = 0xBBB

0xB62
0xFF0
0xA44
```
Feedback please!

I value your feedback and use it to pace the lectures and improve your overall learning experience. If you have any feedback from today’s lecture, please follow the link below. Please remember to keep your feedback constructive, so I can action it and improve the learning experience.

https://forms.microsoft.com/r/dKssTn3AU4
WHAT DID WE LEARN TODAY?

LINKED LIST
- Traverse a list
  linked_list.c

LINKED LIST
- Insert anywhere
  linked_list.c
