COMP1511/1911 Programming Fundamentals Lecture 1 The Beginning	
What is computing?	
What is programming?	

### **Today's Lecture**

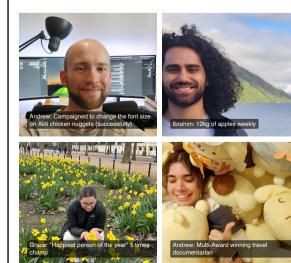

- Important details about the lecture format
- How to get help when you need it
- How COMP1511 works
- What is programming?
- Working in Linux
- A first look at C

#### Who am I?

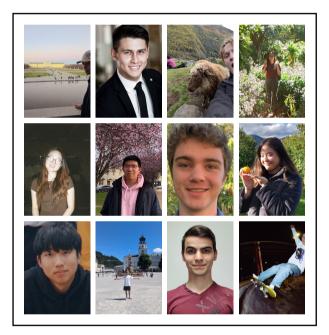

- Programming
- Tennis UTR 5.0
- Coffee
- Favouritelanguages:Typescript,Python, C!

#### Course admins!

### We have Lecture Moderators!

# And we can't wait to meet you all <3

Let's take 5 mins to introduce yourself to your neighbours (physical or virtual)

Programming Fundamentals	

Computers, compilers, programs, C, operating systems, UNIX, Linux, Terminal, Files, functions, oh my	
What is a computer?	
What is Programming? Producing a set of instructions and/or data to achieve a task	

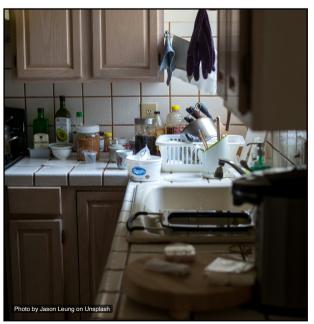

### Writing a program is like writing a recipe

- You provide the steps required to solve the task
- The computer executes the program, completing it step by step
- Any mistakes in your recipe will alter the final product (and probably ruin it!)

### How do these *programs* run?

- Computers are made up of many programs, many executing at the same time!
- Imagine if your kitchen was used to prepare tens, hundreds of recipes all at once

### We need a head chef (operating system)!

An Operating System is the interface between the user and the computer hardware

Operating Systems:

- Execute user programs
- Make sure programs do what they're supposed to
- Schedules access to limited resources (hardware)
- Make the computer system convenient to use

# The Linux Operating System

- A UNIX-based operating system
- Open-Source, reliable, lightweight and secure

	•
	•

### How do programmers interact with a computer?

#### **The Terminal**

- Send text-based commands to our shell
- Terminal handles user input, rendering shell output

#### The Shell

The shell, (bash, zsh) is a program that executes commands, and has its own syntax. It returns output which the terminal can display

.....

### **The Prompt** The prompt is controlled by the shell, and is the line of ..... text which displays some ...... information ...... z3534499@vx10:~\$ ..... ..... How do I use this thing? Important terminal commands - 1s: Lists all the files in the current directory: - mkdir <dir name> Makes a new directory called directoryName: - cd <dir name>: Changes the current directory to directoryName: - cd ...: Moves up one level of directories (one folder level): - pwd: Tells you where you are in the directory structure at the moment:

#### File operations

- cp <source> <destination>: Copy
  a file from the source to the destination
- mv <source> <destination>: Move a file from the source to the destination (can also be used to rename)

rm filename: Remove a file (delete)

The -r tag can be added to cp or rm commands to recursively go through a directory and perform the command on all the files

cp -r <source> <desitnation>

## But Jake! I don't have a Linux computer!!!

Don't worry! We have one for you <3

### Let's get set up together - Log into VLAB ..... - Open the Terminal - Run 1511 setup ...... ...... ..... ..... Now we have the tools, so can we write out first program yet? - Computers execute precise instructions described in a native language to computers - This language is not easy for us to understand: 00000000: 0100 0000 0000 0000 00000010: 1011 0110 0000 0000 0000 0000 0000 0010 00000020: 0000 0100 0110 0000 1001 0000 0000 0000

	1
Computers need	
precision!	
So machine code is too precise	
Why can't we just say "Hey	
computer! Add two	
numbers together!	
Duagramming	
Programming	
Precise enough to be translated to machine code	
Simple enough that a human can (sometimes)	
understand it.	
A <i>shared</i> language	
	1
	]
Programming in C	
Why C?	

### And what a beautiful language

```
#include <stdio.h>
int main(void)
{
    printf("Hello
world");
    return 0;
}
```

Demo	(follow	along	if	you
can)				

- 1. Create a .c file using the Terminal
- 2. Write our hello world program using VSCode
- 3. Save it

#### Let's break it down

```
// loads the standard
input/output library
#include <stdio.h>

// the main function, the
starting point of our program
int main(void) {
    // prints the string to the
standard output
    printf("Hello world");

    // returns 0 to the operating
system
    return 0;
}
```

#### #include <stdio>

- Some tasks are so common, that it would be wasteful to have to write them every time
- Common code is available for us, in the standard C library
- We need to tell the compiler which libraries to use

# 4	na	ludo	<stdi< th=""><th>~&gt;</th></stdi<>	~>
# 7	LHC.	rude	SLUI	.0/

 In this case, we want the Standard Input Output Library

This allows us to make text appear on the terminal

Almost every C program you will write in this course will have this line

#### The main block

```
int main(void) {
    ...
}
```

- The main function
- Every C program must have 1 main function! It's where our program starts!
- Program runs in sequence, lineby-line starting inside the main block

#### **Blocks of code**

{			
}	• • •		

Between each { and } are a block, or group of instructions.

Blocks are very important! They are how we organise code

The	printf
	F

```
{
    printf("Hello
world!");
}
```

printf() makes text appear on the screen. It is a function from stdio.h which we included.

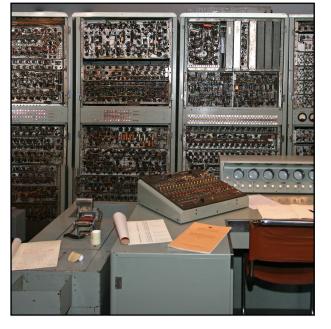

#### return 0

return is a C keyword that tells the computer that we are now delivering the output of a function.

A main function that returns 0 is signifying a correct outcome of the program back to the operating system

### Comments! - We place "comments" in programs explain to our future selves or our colleagues what we intended for this code // in front of a line makes it a comment` If we use /\* and \*/ everything between them will be comments The compiler will ignore comments, so they can be anything you want really! **Compiling** Remember, C is a shared language, so we can be productive Computers can't understand We need to turn our C code into machine code using a compiler Compilers are programs That turn code into machine code. dcc program.c -o helloWorld ./helloWorld This compiles a C program into an executable called

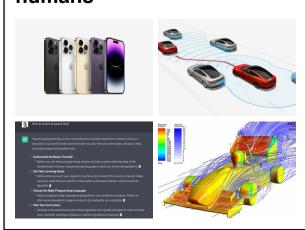

helloWorld, and runs it

Modern technology	has
changed a lot	

But what hasn't changed

# Is computers executing instructions described by humans
