10 types of students

There are only 10 types of students ...

- those that understand binary
- those that don’t understand binary

Decimal Representation

- Can interpret decimal number 4705 as:
  \[ 4 \times 10^3 + 7 \times 10^2 + 0 \times 10^1 + 5 \times 10^0 \]
- The base or radix is 10 ... digits 0 – 9
- Place values:

<table>
<thead>
<tr>
<th>...</th>
<th>1000</th>
<th>100</th>
<th>10</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10^3</td>
<td>10^2</td>
<td>10^1</td>
<td>10^0</td>
</tr>
</tbody>
</table>

- Write number as 4705_{10}
  - Note use of subscript to denote base
Representation in Other Bases

- base 10 is an arbitrary choice
- can use any base
- e.g. could use base 7
- Place values:

<table>
<thead>
<tr>
<th>...</th>
<th>343</th>
<th>49</th>
<th>7</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td>$7^3$</td>
<td>$7^2$</td>
<td>$7$</td>
<td>$7^0$</td>
</tr>
</tbody>
</table>

- Write number as $1216_7$ and interpret as:
  
  
  $1 \times 7^3 + 2 \times 7^2 + 1 \times 7^1 + 6 \times 7^0 = 454_{10}$

Binary Representation

- Modern computing uses binary numbers
  - because digital devices can easily produce high or low level voltages which can represent 1 or 0.
- The base or radix is 2
  - Digits 0 and 1
- Place values:

<table>
<thead>
<tr>
<th>...</th>
<th>8</th>
<th>4</th>
<th>2</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td>$2^3$</td>
<td>$2^2$</td>
<td>$2^1$</td>
<td>$2^0$</td>
</tr>
</tbody>
</table>

- Write number as $1011_2$ and interpret as:
  
  
  $1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 = 11_{10}$

Hexadecimal Representation

- Binary numbers hard for humans to read — too many digits!
- Conversion to decimal awkward and hides bit values
- Solution: write numbers in hexadecimal!
- The base or radix is 16 ...
  - digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F
- Place values:

<table>
<thead>
<tr>
<th>...</th>
<th>4096</th>
<th>256</th>
<th>16</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td>$16^3$</td>
<td>$16^2$</td>
<td>$16^1$</td>
<td>$16^0$</td>
</tr>
</tbody>
</table>

- Write number as $3AF1_{16}$ and interpret as:
  
  
  $3 \times 16^3 + 10 \times 16^2 + 15 \times 16^1 + 1 \times 16^0 = 15089_{10}$

- in C, 0x prefix denotes hexadecimal, e.g. 0x3AF1
Octal & Binary C constants

- Octal (based 8) representation used to be popular for binary numbers
- Similar advantages to hexadecimal
- In C a leading 0 denotes octal, e.g. 07563
- Standard C doesn’t have a way to write binary constants
- Some C compilers let you write 0b
  - OK to use 0b in experimental code but don’t use in important code

```c
printf("%d", 0x2A); // prints 42
printf("%d", 052); // prints 42
printf("%d", 0b101010); // might compile and print 42
```

### Binary Constants

In hexadecimal, each digit represents 4 bits

```
0100 1000 1111 1010 1011 1100 1001 0111
0x 4 8 F A B C 9 7
```

In octal, each digit represents 3 bits

```
01 001 000 111 110 101 011 110 010 010 111
0 1 1 0 7 6 5 3 6 2 2 7
```

In binary, each digit represents 1 bit

```
0b01001000111110101011110010010111
```

### Binary to Hexadecimal

- Example: Convert 1011111000101001₂ to Hex:

- Example: Convert 10111101011100₂ to Hex:
Hexadecimal to Binary

- Reverse the previous process ...
- Convert each hex digit into equivalent 4-bit binary representation
- Example: Convert $AD_{16}$ to Binary:

Representing Negative Integers

- Modern computers almost always use two’s complement to represent integers
- Positive integers and zero represented in obvious way
- Negative integers represented in clever way to make arithmetic in silicon fast/simpler
- For an $n$-bit binary number the representation of $-b$ is $2^n - b$
- E.g., in 8-bit two’s complement $-5$ is represented as $2^8 - 5 = 11111011_2$

Code example: printing all 8 bit two's complement bit patterns

- Some simple code to examine all 8 bit two's complement bit patterns.

```c
for (int i = -128; i < 128; i++) {
    printf("%4d ", i);
    print_bits(i, 8);
    printf("\n");
}
```

$ dcc 8_bit_twos_complement.c print_bits.c -o 8_bit_twos_complement$

source code for 8_bit_twos_complement.c
### Code example: printing all 8 bit twos complement bit patterns

```bash
$ ./8_bit_twos_complement
-128 10000000
-127 10000001
-126 10000010
...
-3 11111101
-2 11111110
-1 11111111
0 00000000
1 00000001
2 00000010
3 00000011
...
125 01111101
126 01111110
127 01111111
```

### Code example: printing bits of int

```c
int a = 0;
printf("Enter an int: ");
scanf("%d", &a);
// sizeof returns number of bytes, a byte has 8 bits
int n_bits = 8 * sizeof a;
print_bits(a, n_bits);
printf("\n");
```

```bash
$ dcc print_bits_of_int.c print_bits.c -o print_bits_of_int
$ ./print_bits_of_int
Enter an int: 42
00000000000000000000000000101010
$ ./print_bits_of_int
Enter an int: -42
11111111111111111111111111010110
```
Many hardware operations work with bytes: 1 byte == 8 bits

C's `sizeof` gives you number of bytes used for variable or type

`sizeof variable` - returns number of bytes to store `variable`

`sizeof (type)` - returns number of bytes to store `type`

On CSE servers, C types have these sizes:

- char = 1 byte = 8 bits, 42 is 00101010
- short = 2 bytes = 16 bits, 42 is 0000000000101010
- int = 4 bytes = 32 bits, 42 is 00000000000000000000000000101010
- double = 8 bytes = 64 bits, 42 = ?

Above are common sizes but not universal on a small embedded CPU

`sizeof (int)` might be 2 (bytes)

---

**Code example: integer_types.c - exploring integer types**

We can use `sizeof` and `limits.h` to explore the range of values which can be represented by standard C integer types on our machine...

```
$ dcc integer_types.c -o integer_types
$ ./integer_types
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Min</th>
<th>Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>char</td>
<td>-128</td>
<td>127</td>
</tr>
<tr>
<td>signed char</td>
<td>-128</td>
<td>127</td>
</tr>
<tr>

<td>9223372036854775807</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>0</td>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>

Source code for `integer_types.c`
#stdint.h - integer types with guaranteed sizes

```c
#include <stdint.h>

// to get below integer types (and more) with guaranteed sizes

// we will use these heavily in COMP1521

// range of values for type
//   minimum              maximum
int8_t i1; // -128          127
uint8_t i2; // 0            255
int16_t i3; // -32768       32767
uint16_t i4; // 0           65535
int32_t i5; // -2147483648 2147483647
uint32_t i6; // 0           4294967295
int64_t i7; // -9223372036854775808 9223372036854775807
uint64_t i8; // 0 18446744073709551615
```

Source code for stdint.h

---

**Code example: char_bug.c**

```
Common C bug:

```c
char c; // c should be declared int
while ((c = getchar()) != EOF) {
    putchar(c);
}
```

Typically stdio.h contains:

```
#define EOF -1
```

- most platforms: char is signed (-128..127)
  - loop will incorrectly exit for a byte containing 0xFF
- rare platforms: char is unsigned (0..255)
  - loop will never exit
