COMP1521 21T3 — MIPS Data

https://www.cse.unsw.edu.au/~cs1521/21T3/
The Memory Subsystem

- memory subsystem typically provides capability to load or store **bytes**
- each byte has unique **address**, think of:
  - memory as implementing a gigantic array of bytes
  - and the address is the array index
- on the MIPS32 machine, all addresses are 32-bit
- most general purpose computers now use 64-bit addresses (and there are 64-bit MIPS)
- typically, a small (1, 2, 4, 8,...) group of bytes can be loaded/stored in single operations
- general purpose computers typically have complex **cache systems** to improve memory performance (not covered in this course)
- operating systems on general purpose computers typically provide **virtual memory** (covered later in this course)
Accessing Memory on the MIPS

- addresses are 32 bit (but there are 64-bit MIPS CPUs)
- only load/store instructions access memory on the MIPS
- 1 byte (8-bit) loaded/stored with `lb`/`sb`
- 2 bytes (16-bit) called a **half-word**, loaded/stored with `lh`/`sh`
- 4 bytes (32-bits) called a **word**, loaded/stored with `lw`/`sw`
- memory address used for load/store instructions is sum of a specified register and a 16-bit constant (often 0) which is part of the instruction
- for `sb` & `sh` operations low (least significant) bits of source register are used.
- `lb`/`lh` assume byte/halfword contains a 8-bit/16-bit **signed** integer
  - high 24/16-bits of destination register set to 1 if 8-bit/16-bit integer negative
- unsigned equivalents `lbu` & `lhu` assume integer is **unsigned**
  - high 24/16-bits of destination register always set to 0
### MIPS Load/Store Instructions

<table>
<thead>
<tr>
<th>assembly</th>
<th>meaning</th>
<th>bit pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lb</code> $r_t$, I($r_s$)</td>
<td>$r_t = \text{mem}[r_s + I]$</td>
<td>100000ssssstttttIIIIIIIIIIIIIIII</td>
</tr>
<tr>
<td><code>lh</code> $r_t$, I($r_s$)</td>
<td>$r_t = \text{mem}[r_s + I]$</td>
<td>100001ssssstttttIIIIIIIIIIIIIIII</td>
</tr>
<tr>
<td><code>lw</code> $r_t$, I($r_s$)</td>
<td>$r_t = \text{mem}[r_s + I]$</td>
<td>100011ssssstttttIIIIIIIIIIIIIIII</td>
</tr>
<tr>
<td><code>sb</code> $r_t$, I($r_s$)</td>
<td>$\text{mem}[r_s + I] = r_t$ &amp; 0xff</td>
<td>101000ssssstttttIIIIIIIIIIIIIIII</td>
</tr>
<tr>
<td><code>sh</code> $r_t$, I($r_s$)</td>
<td>$\text{mem}[r_s + I] = r_t$ &amp; 0xff</td>
<td>101001ssssstttttIIIIIIIIIIIIIIII</td>
</tr>
<tr>
<td><code>sw</code> $r_t$, I($r_s$)</td>
<td>$\text{mem}[r_s + I] = r_t$ &amp; 0xff</td>
<td>101011ssssstttttIIIIIIIIIIIIIIII</td>
</tr>
</tbody>
</table>

Note: The bit patterns are for 32-bit addressing. The `sh` and `sw` instructions have additional memory accesses due to the shift operations.
Code example: storing and loading a value (no labels)

# simple example of load & storing a byte
# we normally use directives and labels

main:
    li $t0, 42
    li $t1, 0x10000000
    sb $t0, 0($t1)  # store 42 in byte at address 0x10000000
    lb $a0, 0($t1)  # load $a0 from same address
    li $v0, 1       # print $a0
    syscall
    li $a0, '\n'    # print '
'
    li $v0, 11
    syscall
    li $v0, 0       # return 0
    jr $ra

source code for load_store_no_label.s

https://www.cse.unsw.edu.au/~cs1521/21T3/
Assembler Directives

SPIM has directives to initialise memory, and to associate labels with addresses.

```
.text # following instructions placed in text segment
.data # following objects placed in data segment
.globl # make symbol available globally

a: .space 18 # int8_t a[18];
.align 2   # align next object on 4-byte addr
i: .word 42 # int32_t i = 42;
v: .word 1,3,5 # int32_t v[3] = {1,3,5};
h: .half 2,4,6 # int16_t h[3] = {2,4,6};
b: .byte 7:5 # int8_t b[5] = {7,7,7,7,7};
f: .float 3.14 # float f = 3.14;
s: .asciiz ”abc” # char s[4] {'a','b','c','\0'};
t: .ascii ”abc” # char t[3] {'a','b','c'};
```

# simple example of storing & loading a byte

main:
    li $t0, 42
    la $t1, x
    sb $t0, 0($t1)  # store 42 in byte at address labelled x
    lb $a0, 0($t1)  # load $a0 from same address
    li $v0, 1     # print $a0
    syscall
    li $a0, '
'    # print '
'
    li $v0, 11     # return 0
    syscall
    li $v0, 0    # set aside 1 byte and associate label x with its address
    jr $ra

data
x: .space 1

source code for load_store.s

https://www.cse.unsw.edu.au/~cs1521/21T3/
Testing Endian-ness

C

```c
uint8_t b;
uint32_t u;
u = 0x03040506;
// load first byte of u
b = *(uint8_t *)&u;
// prints 6 if little-endian
// and 3 if big-endian
printf("%d\n", b);
```

MIPS

```mips
li $t0, 0x03040506
la $t1, u
sw $t0, 0($t1) # u = 0x03040506;
lb $a0, 0($t1) # b = *(uint8_t *)&u;
li $v0, 1       # printf("%d", a0);
```
Setting A Register to An Address

- Note the `la` (load address) instruction is used to set a register to a labelled memory address.
  
  ```
  la $t8, start
  ```

- The memory address will be fixed before the program is run, so this differs only syntactically from the `li` instruction.

- For example, if `vec` is the label for memory address `0x10000100` then these two instructions are equivalent:
  
  ```
  la $t7, vec
  li $t7, 0x10000100
  ```

- In both cases the constant is encoded as part of the instruction(s).

- Neither `la` or `li` access memory! They are very different to `lw` etc
Specifying Addresses: Some SPIM short-cuts

- SPIM allows the constant which is part of load & store instructions can be omitted in the common case it is 0.

```plaintext
sb $t0, 0($t1)  # store $t0 in byte at address in $t1
sb $t0, ($t1)   # same
```

- For convenience, SPIM allows addresses to be specified in a few other ways and will generate appropriate real MIPS instructions.

```plaintext
sb $t0, x       # store $t0 in byte at address labelled x
sb $t1, x+15    # store $t1 15 bytes past address labelled x
sb $t2, x($t3)  # store $t2 $t3 bytes past address labelled x
```

- These are effectively pseudo-instructions.

- You can use these short cuts but won’t help you much

- Most assemblers have similar short cuts for convenience
### SPIM Memory Layout

<table>
<thead>
<tr>
<th>Region</th>
<th>Address</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>.text</td>
<td>0x00400000..</td>
<td>instructions only; read-only; cannot expand</td>
</tr>
<tr>
<td>.data</td>
<td>0x10000000..</td>
<td>data objects; read/write; can be expanded</td>
</tr>
<tr>
<td>.stack</td>
<td>..0x7fffffff</td>
<td>this address and below; read/write</td>
</tr>
<tr>
<td>.ktext</td>
<td>0x80000000..</td>
<td>kernel code; read-only; only accessible in kernel mode</td>
</tr>
<tr>
<td>.kdata</td>
<td>0x90000000..</td>
<td>kernel data; only accessible in kernel mode</td>
</tr>
</tbody>
</table>
Global and static variables need an appropriate number of bytes allocated in `.data` segment, using `.space`:

```markdown
<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Declaration</th>
</tr>
</thead>
<tbody>
<tr>
<td>double</td>
<td>val: .space 8</td>
</tr>
<tr>
<td>char</td>
<td>str: .space 20</td>
</tr>
<tr>
<td>int</td>
<td>vec: .space 80</td>
</tr>
</tbody>
</table>
```

Initialised to 0 by default ... other directives allow initialisation to other values:

```markdown
<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Declaration</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>val: .double 5</td>
</tr>
<tr>
<td>int</td>
<td>arr: .word 9, 8, 7, 6</td>
</tr>
<tr>
<td>char</td>
<td>msg: .asciiz &quot;Hello\n&quot;</td>
</tr>
</tbody>
</table>
```
C

```c
int main(void) {
    int x, y, z;
    x = 17;
    y = 25;
    z = x + y;
}
```

MIPS

```mips
main:
    # x in $t0
    # y in $t1
    # z in $t2
    li   $t0, 17
    li   $t1, 25
    add  $t2, $t1, $t0

    // ...
```
add variables in memory (uninitialized)

C

```c
int x, y, z;
int main(void) {
    x = 17;
y = 25;
z = x + y;
}
```

MIPS (.text)

```mips
main:
    li $t0, 17    # x = 17;
    la $t1, x
    sw $t0, 0($t1)
    li $t0, 25    # y = 25;
    la $t1, y
    sw $t0, 0($t1)
    la $t0, x
    lw $t1, 0($t0)
    la $t0, y
    lw $t2, 0($t0)
    add $t3, $t1, $t2  # z = x + y
    la $t0, z
    sw $t3, 0($t0)
```

MIPS (.data)

```mips
.data
x: .space 4
y: .space 4
z: .space 4
```
C

```c
int x=17, y=25, z;
int main(void) {
    z = x + y;
}
```

MIPS .data

```assembly
.data
x: .word 17
y: .word 25
z: .space 4
```

MIPS .text

```assembly
main:
    la $t0, x
    lw $t1, 0($t0)
    la $t0, y
    lw $t2, 0($t0)
    add $t3, $t1, $t2  # z = x + y
    la $t0, z
    sw $t3, 0($t0)
    la $t0, z
```

https://www.cse.unsw.edu.au/~cs1521/21T3/COMP1521 21T3 — MIPS Data
add variables in memory (array)

C
int x[] = {17,25,0};
int main(void) {
    x[2] = x[0] + x[1];
}

MIPS .data
.data
# int x[] = {17,25,0}
x: .word 17, 25, 0

MIPS .text
main:
    la $t0, x
    lw $t1, 0($t0)
    lw $t2, 4($t0)
    add $t3, $t1, $t2 # z = x + y
    sw $t3, 8($t0)

source code for add_memory_array.s

https://www.cse.unsw.edu.au/~cs1521/21T3/
C

```c
int x[10];

int main(void) {
    // sizeof x[0] == 4
    x[3] = 17;
}
```

MIPS

```
main:
    li $t0, 3

    # each array element is 4 bytes
    mul $t0, $t0, 4
    la $t1, x
    add $t2, $t1, $t0
    li $t3, 17
    sw $t3, 0($t2)

.data
x: .space 40
```
store value in array element - example 2

C

```c
#include <stdint.h>

int16_t x[30];

int main(void) {
    // sizeof x[0] == 2
    x[13] = 23;
}
```

MIPS

```mips
main:
    li $t0, 13
    # each array element is 2 bytes
    mul $t0, $t0, 2
    la $t1, x
    add $t2, $t1, $t0
    li $t3, 23
    sh $t3, 0($t2)

.data
x: .space 60
```
C

```c
int main(void) {
    int i = 0;
    while (i < 5) {
        printf("%d\n", numbers[i]);
        i++;
    }
    return 0;
}
```

Simplified C

```c
int main(void) {
    int i = 0;
    loop:
        if (i >= 5) goto end;
        printf("%d", numbers[i]);
        printf("\n");
        i++;
        goto loop;
    end:
    return 0;
}
```
# print array of ints
# i in $t0

main:
    li $t0, 0  # int i = 0;

loop:
    bge $t0, 5, end  # if (i >= 5) goto end;

Example C with unaligned accesses

```c
uint8_t bytes[32];
uint32_t *i = (int *)&bytes[1];
// illegal store - not aligned on a 4-byte boundary
*i = 0x03040506;
printf("%d\n", bytes[1]);
```

Source code for unalign.c
Example MIPS with unaligned accesses

.data
# data will be aligned on a 4-byte boundary
# most likely on at least a 128-byte boundary
# but safer to just add a .align directive
.align 2
.space 1
v1: .space 1
v2: .space 4
v3: .space 2
v4: .space 4
.space 1
.align 2 # ensure e is on a 4 (2**2) byte boundary
v5: .space 4
.space 1
v6: .word 0 # word directive aligns on 4 byte boundary

source code for unalign.s

https://www.cse.unsw.edu.au/~cs1521/21T3/
Example MIPS with unaligned accesses

```mips
li $t0, 1               # will succeed because no alignment needed
sb $t0, v1             # will fail because v1 is not 2-byte aligned
sh $t0, v1             # will fail because v1 is not 4-byte aligned
sw $t0, v2             # will succeed because v2 is 2-byte aligned
sh $t0, v2             # will fail because v2 is not 4-byte aligned
sw $t0, v3             # will succeed because v3 is 2-byte aligned
sh $t0, v3             # will fail because v3 is not 4-byte aligned
sw $t0, v4             # will succeed because v4 is 2-byte aligned
sw $t0, v4             # will succeed because v4 is 4-byte aligned
sw $t0, v5             # will succeed because v5 is 4-byte aligned
sw $t0, v6             # will succeed because v6 is 4-byte aligned
li $v0, 0              # return
jr $ra                  # return
```

source code for unalign.s
C data structures and their MIPS representations:

- `char` ... as byte in memory, or register
- `int` ... as 4 bytes in memory, or register
- `double` ... as 8 bytes in memory, or register
- `arrays` ... sequence of bytes in memory, elements accessed by index (calculated on MIPS)
- `structs` ... sequence of bytes in memory, accessed by fields (constant offsets on MIPS)

A `char`, `int` or `double`

- can be stored in register if local variable and no pointer to it
- otherwise stored on stack if local variable
- stored in data segment if global variable
C

```c
int vec[5]={0,1,2,3,4};
// ...
int *p = &vec[0];
int *end = &vec[4];
while (p <= end) {
    int y = *p;
    printf("%d", y);
    p++;
}
// ....
```

- p in $s0
- end in $s1

MIPS

```mips
li $s0, vec
la $t0, vec
add $s1, $t0, 16
loop:
    bgt $s0, $s1, end
    lw $a0, 0($s0)
    li $v0, 1
    syscall
    addi $s0, $s0, 4
    b loop
end:
.data
vec: .word 0, 1, 2, 3, 4
```
Computing sum of 2-d Array : C

Assume we have a 2d-array:

```c
int32_t matrix[6][5];
```

We can sum its value like this in C

```c
int row, col, sum = 0;
// row-by-row
for (row = 0; row < 6; row++) {
    // col-by-col within row
    for (col = 0; col < 5; row++) {
        sum += matrix[row][col];
    }
}
```

MIPS directives for an equivalent 2d-array

```c
.data
matrix: .space 120 # 6 * 5 == 30 array elements each 4 bytes
```

https://www.cse.unsw.edu.au/~cs1521/21T3/
Computing sum of 2-d Array : MIPS

```
li   $s0, 0  # sum = 0
li   $s2, 0  # row = 0

loop1: bge $s2, 6, end1  # if (row >= 6) break
li   $s4, 0  # col = 0

loop2: bge $s4, 5, end2  # if (col >= 5) break
la   $t0, matrix
mul  $t1, $s2, 20  # t1 = row*rowsize
mul  $t2, $s4, 4   # t2 = col*intsize
add  $t3, $t0, $t1 # offset = t0+t1
add  $t4, $t3, $t2 # offset = t0+t1
lw   $t5, 0($t4)   # t0 = *(matrix+offset)
add  $s0, $s0, $t5 # sum += t0
addi $s4, $s4, 1  # col++
j    loop2

end2: addi $s2, $s2, 1  # row++
j    loop1

end1:
```
struct _student {
    int id;
    char family[20];
    char given[20];
    int program;
    double wam;
};
C `struct` definitions effectively define a new type.

```c
// new type called "struct student"
struct student {...};

// new type called student_t
typedef struct student student_t;
```

Instances of structures can be created by allocating space:

```c
# sizeof(Student) == 56
stu1:  # student_t stu1;
  .space 56

stu2:  # student_t stu2;
  .space 56

stu:  # student_t *stu;
  .space 4
```
Implementing Structs in MIPS

Accessing structure components is by offset, not name

```mips
li $t0, 5012345
la $t1, stu1
sw $t0, 0($t1)  # stu1.id = 5012345;
li $t0, 3778
sw $t0, 44($t1)  # stu1.program = 3778;
la $s1, stu2  # stu = &stu2;
li $t0, 3707
sw $t0, 44($s1)  # stu->program = 3707;
li $t0, 5034567
sw $t0, 0($s1)  # stu->id = 5034567;
```
