COMP1521 22T3 — Integers

https://www.cse.unsw.edu.au/~cs1521/22T3/
There are only 10 types of students ...

- those that understand binary
- those that don't understand binary
Decimal Representation

- Can interpret decimal number 4705 as:
  \[ 4 \times 10^3 + 7 \times 10^2 + 0 \times 10^1 + 5 \times 10^0 \]

- The base or radix is 10 ... digits 0 – 9

- Place values:
  
  \[
  \begin{array}{cccc}
    \ldots & 1000 & 100 & 10 & 1 \\
    \ldots & 10^3 & 10^2 & 10^1 & 10^0 \\
  \end{array}
  \]

- Write number as \( 4705_{10} \)
  - Note use of subscript to denote base
• base 10 is an arbitrary choice
• can use any base
• e.g. could use base 7
• Place values:

\[
\begin{array}{cccc}
\ldots & 343 & 49 & 7 & 1 \\
\ldots & 7^3 & 7^2 & 7^1 & 7^0 \\
\end{array}
\]

• Write number as \(1216_7\) and interpret as:

\[
1 \times 7^3 + 2 \times 7^2 + 1 \times 7^1 + 6 \times 7^0 = 454_{10}
\]
Modern computing uses binary numbers because digital devices can easily produce high or low level voltages which can represent 1 or 0.

The base or radix is 2
Digits 0 and 1

Place values:

\[
\begin{array}{cccc}
\cdots & 8 & 4 & 2 & 1 \\
\cdots & 2^3 & 2^2 & 2^1 & 2^0 \\
\end{array}
\]

Write number as \(1011_2\) and interpret as:

\[
1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 = 11_{10}
\]
Hexadecimal Representation

- Binary numbers hard for humans to read — too many digits!
- Conversion to decimal awkward and hides bit values
- Solution: write numbers in hexadecimal!
- The base or radix is 16 ... digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F
- Place values:

<table>
<thead>
<tr>
<th></th>
<th>4096</th>
<th>256</th>
<th>16</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>16³</td>
<td>16²</td>
<td>16¹</td>
<td>16⁰</td>
<td></td>
</tr>
</tbody>
</table>

- Write number as $3AF1_{16}$ and interpret as:
  $3 \times 16^3 + 10 \times 16^2 + 15 \times 16^1 + 1 \times 16^0 = = 15089_{10}$
- in C, `0x` prefix denotes hexadecimal, e.g. `0x3AF1`
Octal & Binary C constants

- Octal (based 8) representation used to be popular for binary numbers
- Similar advantages to hexadecimal
- In C a leading `0` denotes octal, e.g. `07563`
- Standard C doesn’t have a way to write binary constants
- Some C compilers let you write `0b`
  - OK to use `0b` in experimental code but don’t use in important code

```c
printf("%d", 0x2A);     // prints 42
printf("%d", 052);      // prints 42
printf("%d", 0b101010); // might compile and print 42
```
Binary Constants

In hexadecimal, each digit represents 4 bits

0100 1000 1111 1010 1011 1100 1001 0111
0x 4 8 F A B C 9 7

In octal, each digit represents 3 bits

01 001 000 111 110 101 011 110 010 010 111
0 1 1 0 7 6 5 3 6 2 2 7

In binary, each digit represents 1 bit

0b01001000111110101011110010010111
Example: Convert $101111000101001_2$ to Hex:

Example: Convert $10111101011100_2$ to Hex:
Hexadecimal to Binary

- Reverse the previous process ...
- Convert each hex digit into equivalent 4-bit binary representation
- Example: Convert $AD5_{16}$ to Binary:
Representing Negative Integers

- modern computers almost always use two's complement to represent integers
- positive integers and zero represented in obvious way
- negative integers represented in clever way to make arithmetic in silicon fast/simpler
- for an n-bit binary number the representation of \(-b\) is \(2^n - b\)
- e.g. in 8-bit two's complement \(-5\) is represented as \(2^8 - 5 = 11110112\)
Some simple code to examine all 8 bit twos complement bit patterns.

```c
for (int i = -128; i < 128; i++) {
    printf("%4d ", i);
    print_bits(i, 8);
    printf("\n");
}
```

$ dcc 8_bit_twos_complement.c print_bits.c -o 8_bit_twos_complement

https://www.cse.unsw.edu.au/~cs1521/22T3/
Code example: printing all 8 bit twos complement bit patterns

$ ./8_bit_twos_complement
-128 10000000
-127 10000001
-126 10000010
...
-3 11111101
-2 11111110
-1 11111111
0 00000000
1 00000001
2 00000010
3 00000011
...
125 01111101
126 01111110
127 01111111
Code example: printing bits of int

```c
int a = 0;
printf("Enter an int: ");
scanf("%d", &a);
// sizeof returns number of bytes, a byte has 8 bits
int n_bits = 8 * sizeof a;
print_bits(a, n_bits);
printf("\n");
```

**Source code for print_bits_of_int.c**
```
$ dcc print_bits_of_int.c print_bits.c -o print_bits_of_int
$ ./print_bits_of_int
Enter an int: 42
00000000000000000000000000101010
$ ./print_bits_of_int
Enter an int: -42
111111111111111111111111010110
```

https://www.cse.unsw.edu.au/~cs1521/22T3/COMP1521 22T3 — Integers
Code example: printing bits of int

```
$ ./print_bits_of_int
Enter an int: 0
00000000000000000000000000000000
$ ./print_bits_of_int
Enter an int: 1
00000000000000000000000000000001
$ ./print_bits_of_int
Enter an int: -1
11111111111111111111111111111111
$ ./print_bits_of_int
Enter an int: 2147483647
01111111111111111111111111111111
$ ./print_bits_of_int
Enter an int: -2147483648
10000000000000000000000000000000
$  
```
Many hardware operations work with bytes: 1 byte == 8 bits

C’s `sizeof` gives you the number of bytes used for a variable or type.

`sizeof variable` - returns the number of bytes to store the variable.

`sizeof (type)` - returns the number of bytes to store the type.

On CSE servers, C types have these sizes:

- `char` = 1 byte = 8 bits, 42 is 00101010
- `short` = 2 bytes = 16 bits, 42 is 0000000000101010
- `int` = 4 bytes = 32 bits, 42 is 00000000000000000000000000101010
- `double` = 8 bytes = 64 bits, 42 is ?

The above are common sizes but not universal on a small embedded CPU. `sizeof (int)` might be 2 (bytes).
We can use `sizeof` and `limits.h` to explore the range of values which can be represented by standard C integer types on our machine...

```
$ dcc integer_types.c -o integer_types
$ ./integer_types

[source code for integer_types.c](https://www.cse.unsw.edu.au/~cs1521/22T3/)
#include <stdint.h>

- to get below integer types (and more) with guaranteed sizes

- we will use these heavily in COMP1521

```c
// range of values for type
// minimum maximum
int8_t i1; // -128 127
uint8_t i2; // 0 255
int16_t i3; // -32768 32767
uint16_t i4; // 0 65535
int32_t i5; // -2147483648 2147483647
uint32_t i6; // 0 4294967295
int64_t i7; // -9223372036854775808 9223372036854775807
uint64_t i8; // 0 18446744073709551615
```

source code for stdint.c
Common C bug:

```c
char c;  // c should be declared int    (int16_t would work, int is better)
while ((c = getchar()) != EOF) {
    putchar(c);
}
```

Typically `stdio.h` contains:

```c
#define EOF -1
```

- most platforms: char is signed (-128..127)
  - loop will incorrectly exit for a byte containing 0xFF
- rare platforms: char is unsigned (0..255)
  - loop will never exit
