COMP1521 23T2 — Floating-Point Numbers

https://www.cse.unsw.edu.au/~cs1521/23T2/
C has three floating point types

- **float** ... typically 32-bit (lower precision, narrower range)
- **double** ... typically 64-bit (higher precision, wider range)
- **long double** ... typically 128-bits (but maybe only 80 bits used)

Floating point constants, e.g.: 3.14159 1.0e-9 are **double**

Reminder: division of 2 ints in C yields an int.

  - but division of double and int in C yields a double.
```c
double d = 4/7.0;
// prints in decimal with (default) 6 decimal places
printf("%lf\n", d);  // prints 0.571429
// prints in scientific notation
printf("%le\n", d);  // prints 5.714286e-01
// picks best of decimal and scientific notation
printf("%lg\n", d);  // prints 0.571429
// prints in decimal with 9 decimal places
printf("%.9lf\n", d);  // prints 0.571428571
// prints in decimal with 1 decimal place and field width of 5
printf("%10.1lf\n", d);  // prints 0.6
```

double d = 4/7.0;
// prints in decimal with (default) 6 decimal places
printf("%lf\n", d);  // prints 0.571429
// prints in scientific notation
printf("%le\n", d);  // prints 5.714286e-01
// picks best of decimal and scientific notation
printf("%lg\n", d);  // prints 0.571429
// prints in decimal with 9 decimal places
printf("%.9lf\n", d);  // prints 0.571428571
// prints in decimal with 1 decimal place and field width of 5
printf("%10.1lf\n", d);  // prints 0.6

source code for float_output.c
Floating Point Numbers

- can have fractional numbers in other bases, e.g.: $110.101_2 = 6.625_{10}$
- if we represent floating point numbers with a fixed small number of bits
  - there are only a finite number of bit patterns
  - can only represent a finite subset of reals
- almost all real values will have no exact representation
- value of arithmetic operations may be real with no exact representation
- we must use closest value which can be exactly represented
- this approximation introduces an error into our calculations
- often, does not matter
- sometimes ... can be disastrous
fixed-point is a simple trick to represent fractional numbers as integers
- every value is multiplied by a particular constant, e.g. 1000 and stored as integer
- so if constant is 1000, could represent 56.125 as an integer (56125)
- but not 3.141592

usable for some problems, but not ideal

used on small embedded processors without silicon floating point

major limitation is only small range of values can be represented
- for example with 32 bits, and using 65536 (2^{16}) as constant
  - 16 bits used for integer part
  - 16 bits used for the fraction
- minimum $2^{-16} \approx 0.000015$
- maximum $2^{15} \approx 32768$
you've met scientific notation, e.g. $6.0221515 \times 10^{23}$ elsewhere

- we can represent numbers in a similar way to scientific notation

  - but using binary, e.g. $1.0101011 \times 2^{11.2} = 1.3359375 \times 8 = 10.6875$

  - allows much bigger range of values than fixed point

  - using only 8 bits for the exponent, we can represent numbers from $10^{-38}$ .. $10^{+38}$

  - using only 11 bits for the exponent, we can represent numbers from $10^{-308}$ .. $10^{+308}$

  - leads to numbers close to zero have higher precision (more accurate) which is good
choosing which exponential representation

- exponent notation allows multiple representations for a single value
  - e.g. $1.0101011 \times 2^{11} = 10.6875$ and $10.101011 \times 2^{10} = 10.6875$

- having multiple representations would make arithmetic slower on CPU

- want only one representation (one bit pattern) representing a value

- decision - use representation with exactly one digit in front of decimal point
  - use $1.0101011 \times 2^{11}$, not $10.101011 \times 2^{10}$ or $1010.1011 \times 2^0$
  - this is called normalization

- weird hack: as we are using binary the first digit must be a one we don’t need to represent it
  - as we long we have a separate representation for zero
floating_types.c - print characteristics of floating point types

float f;
double d;
long double l;

printf("float %2lu bytes min=%-12g max=%g\n", sizeof f, FLT_MIN, FLT_MAX);
printf("double %2lu bytes min=%-12g max=%g\n", sizeof d, DBL_MIN, DBL_MAX);
printf("long double %2lu bytes min=%-12Lg max=%Lg\n", sizeof l, LDBL_MIN, LDBL_MAX);

$ ./floating_types
float 4 bytes min=1.17549e-38 max=3.40282e+38
double 8 bytes min=2.22507e-308 max=1.79769e+308
long double 16 bytes min=3.3621e-4932 max=1.18973e+4932

https://www.cse.unsw.edu.au/~cs1521/23T2/
IEEE 754 standard

- C floats almost always IEEE 754 single precision (binary32)
- C double almost always IEEE 754 double precision (binary64)
- C long double might be IEEE 754 (binary128)
- IEEE 754 representation has 3 parts: sign, fraction and exponent
- numbers have form $sign \, fraction \times 2^{exponent}$, where $sign$ is +/-
- fraction always has 1 digit before decimal point (normalized)
- exponent is stored as positive number by adding constant value (bias)
Floating Point Numbers

Example of normalising the fraction part in binary:

- $1010.1011$ is normalized as $1.0101011 \times 2^{011}$
- $1010.1011 = 10 + 11/16 = 10.6875$
- $1.0101011 \times 2^{011} = (1 + 43/128) \times 2^3 = 1.3359375 \times 8 = 10.6875$

The normalised fraction part always has $1$ before the decimal point.

Example of determining the exponent in binary:

- if exponent is 8-bits, then the bias $= 2^{8-1} - 1 = 127$
- valid bit patterns for exponent are $00000001 .. 11111110$
- these correspond to exponent values of $-126 .. 127$
Floating Point Numbers

Internal structure of floating point values

- Single precision
  - Sign: 1 bit
  - Exponent: 8 bits
  - Fraction: 23 bits

- Double precision
  - Sign: 1 bit
  - Exponent: 11 bits
  - Fraction: 52 bits

https://www.cse.unsw.edu.au/~cs1521/23T2/
Distribution of Floating Point Numbers

- floating point numbers not evenly distributed

- representations get further apart as values get bigger
  - this works well for most calculations
  - but can cause weird bugs

- double (IEEE 754 64 bit) has 52-bit fractions so:

- between $2^n$ and $2^{n+1}$ there are $2^{52}$ doubles evenly spaced
  - e.g. in the interval $2^{-42}$ and $2^{-43}$ there are $2^{52}$ doubles
  - and in the interval between 1 and 2 there are $2^{52}$ doubles
  - and in the interval between $2^{42}$ and $2^{43}$ there are $2^{52}$ doubles

- so near 0.001 doubles are about 0.0000000000000000002 apart

- so near 1000 doubles are about 0.00000000000000002 apart

- so near 1000000000000000 doubles are about 0.25 apart

- above $2^{53}$ doubles are more than 1 apart
0.15625 is represented in IEEE-754 single-precision by these bits:
00111110001000000000000000000000

IEEE 754 has a representation for +/- infinity
propagates sensibly through calculations

double x = 1.0/0.0;
printf("%lf\n", x); //prints inf
printf("%lf\n", -x); //prints -inf
printf("%lf\n", x - 1); // prints inf
printf("%lf\n", 2 * atan(x)); // prints 3.141593
printf("%d\n", 42 < x); // prints 1 (true)
printf("%d\n", x == INFINITY); // prints 1 (true)

source code for infinity.c
C (IEEE-754) has a representation for invalid results:
  - NaN (not a number)

ensures errors propagates sensibly through calculations

```c
double x = 0.0/0.0;
printf("%lf\n", x); // prints nan
printf("%lf\n", x - 1); // prints nan
printf("%d\n", x == x); // prints 0 (false)
printf("%d\n", isnan(x)); // prints 1 (true)
```

source code for nan.c
$ ./explain_float_representation inf
inf is represented in IEEE-754 single-precision by these bits:
01111111110000000000000000000000

sign | exponent | fraction
    0 | 11111111 | 00000000000000000000000

sign bit = 0
sign = +
raw exponent = 1111111 binary
            = 255 decimal

number = +inf

https://www.cse.unsw.edu.au/~cs1521/23T2/
$ ./explain_float_representation 01111111110000000000000000000000
sign bit = 0
sign = +
raw exponent = 1111111 binary
= 255 decimal
number = NaN

source code for explain_float_representation.c
Consequences of most reals not having exact representations

```c
double a, b;
a = 0.1;
b = 1 - (a + a + a + a + a + a + a + a + a + a);
if (b != 0) {
    // better would be fabs(b) > 0.000001
    printf("1 != 0.1+0.1+0.1+0.1+0.1+0.1+0.1+0.1+0.1+0.1\n");
}
printf("b = %g\n", b); // prints 1.1022e-16
```

- do not use `==` and `!=` with floating point values
- instead check if values are close
Consequences of most reals not having exact representations

```c
double x = 0.0000000011;
double y = (1 - cos(x)) / (x * x);
// correct answer y = ~0.5
// prints y = 0.917540
printf("y = %lf\n", y);
// division of similar approximate value
// produces large error
// sometimes called catastrophic cancellation
printf("%g\n", 1 - cos(x)); // prints 1.11022e-16
printf("%g\n", x * x); // prints 1.21e-16
```

source code for double_catastrophe.c

https://www.cse.unsw.edu.au/~cs1521/23T2/
Another reason not to use == with floating point values

```c
if (d == d) {
    printf("d == d is true\n");
} else {
    // will be executed if d is a NaN
    printf("d == d is not true\n");
}
if (d == d + 1) {
    // may be executed if d is large
    // because closest possible representation for d + 1
    // is also closest possible representation for d
    printf("d == d + 1 is true\n");
} else {
    printf("d == d + 1 is false\n");
}
```

source code for double_not_always.c

https://www.cse.unsw.edu.au/~cs1521/23T2/
Another reason not to use == with floating point values

$ dcc double_not_always.c -o double_not_always
$ ./double_not_always 42.3
   d = 42.3
   d == d is true
   d == d + 1 is false
$ ./double_not_always 4200000000000000000
   d = 4.2e+18
   d == d is true
   d == d + 1 is true
$ ./double_not_always NaN
   d = nan
   d == d is not true
   d == d + 1 is false

because closest possible representation for d + 1 is also closest possible representation for d

source code for double_not_always.c
Consequences of most reals not having exact representations

```c
// loop looks to print 10 numbers but actually never terminates
double d = 9007199254740990;
while (d < 9007199254741000) {
    printf("%lf\n", d); // always prints 9007199254740992.000000
    // 9007199254740993 can not be represented as a double
    // closest double is 9007199254740992.0
    // so 9007199254740992.0 + 1 = 9007199254740992.0
    d = d + 1;
}
```

9007199254740993 is $2^{53} + 1$
- it is smallest integer which can not be represented exactly as a double
- The closest double to 9007199254740993 is 9007199254740992.0
- aside: 9007199254740993 can not be represented by a int32_t
  it can be represented by int64_t
Exercise: Floating point → Decimal

Convert the following floating point numbers to decimal.

Assume that they are in IEEE 754 single-precision format.

0 10000000 11000000000000000000000

1 01111110 10000000000000000000000
