Floating Point Numbers

- C has three floating point types
  - `float` … typically 32-bit (lower precision, narrower range)
  - `double` … typically 64-bit (higher precision, wider range)
  - `long double` … typically 128-bits (but maybe only 80 bits used)
- Floating point constants, e.g.: `3.14159 1.0e-9` are `double`
- Reminder: division of 2 ints in C yields an int.
  - but division of double and int in C yields a double.

Floating Point Number - Output

double d = 4/7.0;
// prints in decimal with (default) 6 decimal places
printf("%lf\n", d);  // prints 0.571429
// prints in scientific notation
printf("%le\n", d);  // prints 5.714286e-01
// picks best of decimal and scientific notation
printf("%lg\n", d);  // prints 0.571429
// prints in decimal with 9 decimal places
printf("%.9lf\n", d);  // prints 0.571428571
// prints in decimal with 1 decimal place and field width of 5
printf("%10.1lf\n", d);  // prints 0.6

source code for float_output.c
Floating Point Numbers

- can have fractional numbers in other bases, e.g. $110.101_2 = 6.625_{10}$
- if we represent floating point numbers with a fixed small number of bits
  - there are only a finite number of bit patterns
  - can only represent a finite subset of reals
- almost all real values will have no exact representation
- value of arithmetic operations may be real with no exact representation
- we must use closest value which can be exactly represented
- this approximation introduces an error into our calculations
- often, does not matter
- sometimes ... can be disastrous

Fixed-Point Representation

- fixed-point is a simple trick to represent fractional numbers as integers
  - every value is multiplied by a particular constant, e.g. 1000 and stored as integer
  - so if constant is 1000, could represent 56.125 as an integer (56125)
  - but not 3.141592
- usable for some problems, but not ideal
- used on small embedded processors without silicon floating point
- major limitation is only small range of values can be represented
  - for example with 32 bits, and using $65536 = 2^{16}$ as constant
    - 16 bits used for integer part
    - 16 bits used for the fraction
    - minimum $2^{-16} \approx 0.000015$
    - maximum $2^{15} \approx 32768$

exponential representation - a better approach

- you met scientific notation, e.g. $6.0221515 \times 10^{23}$ in physics or other science classes
- we can represent numbers on a computer in a similar way to scientific notation
- but using binary instead of base ten, e.g. $1.0101011_2 \times 2^{11.2} = 1.3359375 \times 8 = 10.6875$
- allows a much bigger range of values to be represented than fixed point
- using only 8 bits for the exponent, we can represent numbers from $10^{-38} \ldots 10^{+38}$
- using only 11 bits for the exponent, we can represent numbers from $10^{-308} \ldots 10^{+308}$
- leads to numbers close to zero having higher precision (more accurate) which is good
choosing which exponentional representation

- exponent notation allows multiple representations for a single value
  - e.g. $1.0101011 \times 2^{11}$ and $10.1011\times 2^{10}$
- having multiple representations would make implementing arithmetic slower on CPU
- better to have only one representation (one bit pattern) representing a value
- decision - use representation with exactly one digit in front of decimal point
  - use $1.0101011 \times 2^{11}$ not $10.1011\times 2^{10}$ or $1010.1011 \times 2^{0}$
  - this is called normalization
- weird hack: as we are using binary the first digit must be a one we don't need to store it
  - as we long we have a separate representation for zero

floating_types.c - print characteristics of floating point types

```c
float f;
double d;
long double l;
printf("float %2lu bytes min=%-12g max=%g\n", sizeof f, FLT_MIN, FLT_MAX);
printf("double %2lu bytes min=%-12g max=%g\n", sizeof d, DBL_MIN, DBL_MAX);
printf("long double %2lu bytes min=%-12Lg max=%Lg\n", sizeof l, LDBL_MIN, LDBL_MAX);
```

source code for floating_types.c

```
$ ./floating_types
float 4 bytes min=1.17549e-38 max=3.40282e+38
double 8 bytes min=2.22507e-308 max=1.79769e+308
long double 16 bytes min=3.3621e-4932 max=1.18973e+4932
```

IEEE 754 - history

- 1970s Intel building microprocessors (single-chip CPUs)
- 1976 Intel developing coprocessor (separate chip) for floating-point arithmetic
- Intel asked William Kahan, University of California to design format
- other manufacturers didn’t want to be left out
- IEEE 754 standard working group formed
- Kahan and others produced well-designed robust specification
- accepted by manufacturers who begin using it for new architectures
- IEEE 754 standard released in 1985 (update to standard in 2008)
- today, almost all computers use IEEE 754
IEEE 754 standard

- C floats almost always IEEE 754 single precision (binary32)
- C double almost always IEEE 754 double precision (binary64)
- C long double might be IEEE 754 (binary128)
- IEEE 754 representation has 3 parts: sign, fraction and exponent
  - numbers have form $sign \ fraction \times 2^{exponent}$, where $sign$ is +/-
  - $fraction$ always has 1 digit before decimal point (normalized)
  - $exponent$ is stored as positive number by adding constant value (bias)

Floating Point Numbers

Example of normalising the fraction part in binary:

- $1010.1011$ is normalized as $1.0101011 \times 2^{011}$
- $1010.1011 = 10 + 11/16 = 10.6875$
- $1.0101011 \times 2^{011} = (1 + 43/128) \times 2^{3} = 1.3359375 \times 8 = 10.6875$

The normalised fraction part always has 1 before the decimal point.

Example of determining the exponent in binary:

- if exponent is 8-bits, then the bias = $2^{8-1} - 1 = 127$
- valid bit patterns for exponent are 00000001 .. 11111110
- these correspond to exponent values of -126 .. 127

Internal structure of floating point values

![Diagram of floating point values](https://www.cse.unsw.edu.au/~cs1521/23T3/COMP1521_23T3---Floating-Point-Numbers 11 / 28)
Distribution of Floating Point Numbers

- floating point numbers not evenly distributed
- representations get further apart as values get bigger
  - this works well for most calculations
  - but can cause weird bugs

- double (IEEE 754 64 bit) has 52-bit fractions so:
  - between $2^n$ and $2^{n+1}$ there are $2^{52}$ doubles evenly spaced
    - e.g. in the interval $2^{-42}$ and $2^{-43}$ there are $2^{52}$ doubles
    - and in the interval between 1 and 2 there are $2^{52}$ doubles
    - and in the interval between 2$^{42}$ and 2$^{43}$ there are $2^{52}$
  - near 0.001 - doubles are about 0.0000000000000000002 apart
  - near 1000 - doubles are about 0.0000000000002 apart
  - near 1000000000000000 - doubles are about 0.25 apart
  - above $2^{53}$ - doubles are more than 1 apart

IEEE-754 Single Precision example: 0.15625

0.15625 is represented in IEEE-754 single-precision by these bits:

<table>
<thead>
<tr>
<th>sign</th>
<th>exponent</th>
<th>fraction</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>01111100</td>
<td>01000000000000000000000</td>
</tr>
</tbody>
</table>

sign bit = 0
sign = +
raw exponent = 01111100 binary
  = 124 decimal
actual exponent = 124 - exponent_bias
  = 124 - 127
  = -3

number = +1.01000000000000000000000 binary * 2**-3
  = 1.25 decimal * 2**-3
  = 1.25 * 0.125
  = 0.15625

source code for explain_float_representation.c

IEEE-754 Single Precision example: -0.125

$ ./explain_float_representation -0.125
-0.125 is represented as a float (IEEE-754 single-precision) by these bits:

<table>
<thead>
<tr>
<th>sign</th>
<th>exponent</th>
<th>fraction</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>01111100</td>
<td>00000000000000000000000</td>
</tr>
</tbody>
</table>

sign bit = 1
sign = -
raw exponent = 01111100 binary
  = 124 decimal
actual exponent = 124 - exponent_bias
  = 124 - 127
  = -3

number = -1.00000000000000000000000 binary * 2**-3
  = -1 decimal * 2**-3
  = -1 * 0.125
  = -0.125
$ ./explain_float_representation 150.75
150.75 is represented in IEEE-754 single-precision by these bits:
01000110101101100000000000000000
sign | exponent | fraction
  0 | 1000110 | 00101101100000000000000
sign bit = 0
sign = +
raw exponent = 1000110 binary
  = 134 decimal
actual exponent = 134 - exponent_bias
  = 134 - 127
  = 7
number = +1.00101101100000000000000 binary * 2**7
  = 1.177733600566411 binary * 2**7
  = 1.17773 decimal * 2**7
  = 1.17773 * 128
  = 150.75

$ ./explain_float_representation -96.125
-96.125 is represented in IEEE-754 single-precision by these bits:
11000010110000010000000000000000
sign | exponent | fraction
  1 | 1000010 | 10000000100000000000000
sign bit = 1
sign = -
raw exponent = 1000010 binary
  = 133 decimal
actual exponent = 133 - exponent_bias
  = 133 - 127
  = 6
number = -1.10000000100000000000000000000 binary * 2**6

  = -1.50195 * 64
  = -96.125

$ ./explain_float_representation 00111101110011001100110011001101
sign bit = 0
sign = +
raw exponent = 01111011 binary
  = 123 decimal
actual exponent = 123 - exponent_bias
  = 123 - 127
  = -4
number = +1.1001100000000000000000000000000 binary * 2**-4
  = 1.6 decimal * 2**-4
  = 1.6 * 0.0625
  = 0.1
### infinity.c: exploring infinity

- IEEE 754 has a representation for +/- infinity
- propagates sensibly through calculations

```c
double x = 1.0/0.0;
printf("%lf\n", x); // prints inf
printf("%lf\n", -x); // prints -inf
printf("%lf\n", x - 1); // prints inf
printf("%lf\n", 2 * atan(x)); // prints 3.141593
printf("%d\n", 42 < x); // prints 1 (true)
printf("%d\n", x == INFINITY); // prints 1 (true)
```

### nan.c: handling errors robustly

- C (IEEE-754) has a representation for invalid results:
  - NaN (not a number)
- ensures errors propagates sensibly through calculations

```c
double x = 0.0/0.0;
printf("%lf\n", x); // prints nan
printf("%lf\n", x - 1); // prints nan
printf("%d\n", x == x); // prints 0 (false)
printf("%d\n", isnan(x)); // prints 1 (true)
```

### IEEE-754 Single Precision example: inf

```bash
$ ./explain_float_representation inf
inf is represented in IEEE-754 single-precision by these bits:
01111111000000000000000000000000
sign | exponent | fraction
 0 | 11111111 | 000000000000000000000000
sign bit = 0
sign = +
raw exponent = 11111111 binary
  = 255 decimal
number = +inf
```
$ ./explain_float_representation 01111111110000000000000000000000
sign bit = 0
sign = +
raw exponent = 1111111 binary
= 255 decimal
number = NaN

Consequences of most reals not having exact representations

```c
double a, b;
a = 0.1;
b = 1 - (a + a + a + a + a + a + a + a + a + a);
if (b != 0) {
    printf("1 != 0.1+0.1+0.1+0.1+0.1+0.1+0.1+0.1+0.1+0.1\n");
}
printf("b = %g\n", b); // prints 1.11022e-16
```

• do not use == and != with floating point values
• instead check if values are close

```c
double x = 0.000000011;
double y = ( 1 - cos(x)) / (x * x);
// correct answer y = ~0.5
// prints y = 0.917540
printf("y = %lf\n", y);
// division of similar approximate value
// produces large error
// sometimes called catastrophic cancellation
printf("%g\n", 1 - cos(x)); // prints 1.11022e-16
printf("%g\n", x * x); // prints 1.21e-16
```

source code for `explain_float_representation.c`

source code for `double_imprecision.c`

source code for `double_catastrophe.c`
Another reason not to use == with floating point values

```c
if (d == d) {
    printf("d == d is true\n");
} else {
    // will be executed if d is a NaN
    printf("d == d is not true\n");
}
if (d == d + 1) {
    // may be executed if d is large
    // because closest possible representation for d + 1
    // is also closest possible representation for d
    printf("d == d + 1 is true\n");
} else {
    printf("d == d + 1 is false\n");
}
```

source code for `double_not_always.c`

$ dcc double_not_always.c -o double_not_always
$ ./double_not_always 42.3
  d = 42.3
  d == d is true
  d == d + 1 is false
$ ./double_not_always 4.2e+18
  d = 4.2e+18
  d == d is true
  d == d + 1 is true
$ ./double_not_always NaN
  d = nan
  d == d is not true
  d == d + 1 is false

because closest possible representation for d + 1 is also closest possible representation for d

Consequences of most reals not having exact representations

```c
// loop looks to print 10 numbers but actually never terminates
double d = 9007199254740990;
while (d < 9007199254741000) {
    printf("%.16lf\n", d);
    // always prints 9007199254740992.000000
    // 9007199254740993 can not be represented as a double
    // closest double is 9007199254740992.0
    // so 9007199254740992.0 + 1 = 9007199254740992.0
    d = d + 1;
}
```

source code for `double_disaster.c`

- 9007199254740993 is $2^{53} + 1$
  - it is smallest integer which can not be represented exactly as a double
- The closest double to 9007199254740993 is 9007199254740992.0
- aside: 9007199254740993 can not be represented by a int32_t
  - it can be represented by int64_t
Exercise: Floating point → Decimal

Convert the following floating point numbers to decimal.
Assume that they are in IEEE 754 single-precision format.

0 10000000 11000000000000000000000

1 01111110 10000000000000000000000
