

# COMP1521 23T3 — Integers

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 — Integers

1 / 22

## 10 types of students

There are only 10 types of students ...

- those that understand binary
- those that don't understand binary

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 — Integers

2 / 22

## Decimal Representation

- Can interpret decimal number 4705 as:  
$$4 \times 10^3 + 7 \times 10^2 + 0 \times 10^1 + 5 \times 10^0$$
- The *base* or *radix* is 10 ... digits 0 – 9
- Place values:

...	1000	100	10	1
...	$10^3$	$10^2$	$10^1$	$10^0$

- Write number as  $4705_{10}$ 
  - Note use of subscript to denote base

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 — Integers

3 / 22

- base 10 is an arbitrary choice
- can use any base
- e.g. could use base 7
- Place values:

...	343	49	7	1
...	$7^3$	$7^2$	$7^1$	$7^0$

- Write number as  $1216_7$  and interpret as:  
 $1 \times 7^3 + 2 \times 7^2 + 1 \times 7^1 + 6 \times 7^0 = 454_{10}$

## Binary Representation

- Modern computing uses binary numbers
  - because digital devices can easily produce high or low level voltages which can represent 1 or 0.
- The *base* or *radix* is 2  
Digits 0 and 1
- Place values:

...	8	4	2	1
...	$2^3$	$2^2$	$2^1$	$2^0$

- Write number as  $1011_2$  and interpret as:  
 $1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 = 11_{10}$

## Hexadecimal Representation

- Binary numbers hard for humans to read – too many digits!
- Conversion to decimal awkward and hides bit values
- Solution: write numbers in hexadecimal!
- The *base* or *radix* is 16 ... digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F
- Place values:

...	4096	256	16	1
...	$16^3$	$16^2$	$16^1$	$16^0$

- Write number as  $3AF1_{16}$  and interpret as:  
 $3 \times 16^3 + 10 \times 16^2 + 15 \times 16^1 + 1 \times 16^0 = 15089_{10}$
- in C, **0x** prefix denotes hexadecimal, e.g. **0x3AF1**

- Octal (based 8) representation used to be popular for binary numbers
- Similar advantages to hexadecimal
- in C a leading **0** denotes octal, e.g. **07563**
- binary constants were only recently added to C - some C compilers will not recognize them

```
printf("%d", 0x2A);      // prints 42
printf("%d", 052);        // prints 42
printf("%d", 0b101010); // might compile and print 42
```

## Binary Constants

In hexadecimal, each digit represents 4 bits

0100	1000	1111	1010	1011	1100	1001	0111	
0x	4	8	F	A	B	C	9	7

In octal, each digit represents 3 bits

01	001	000	111	110	101	011	110	010	010	111	
0	1	1	0	7	6	5	3	6	2	2	7

In binary, each digit represents 1 bit

**0b01001000111110101011110010010111**

## Binary to Hexadecimal

- Example: Convert  $1011111000101001_2$  to Hex:

- Example: Convert  $10111101011100_2$  to Hex:

- Reverse the previous process ...
- Convert each hex digit into equivalent 4-bit binary representation
- Example: Convert  $AD5_{16}$  to Binary:

## Representing Negative Integers

- modern computers almost always use two's complement to represent integers
- positive integers and zero represented in obvious way
- negative integers represented in clever way to make arithmetic in silicon fast/simpler
- for an n-bit binary number the representation of  $-b$  is  $2^n - b$
- e.g. in 8-bit two's complement  $-5$  is represented as  $2^8 - 5 = 11111011_2$

## Code example: printing all 8 bit twos complement bit patterns

- Some simple code to examine all 8 bit twos complement bit patterns.

```
for (int i = -128; i < 128; i++) {
    printf("%4d ", i);
    print_bits(i, 8);
    printf("\n");
}
```

source code for 8\_bit\_twos\_complement.c

```
$ gcc 8_bit_twos_complement.c print_bits.c -o 8_bit_twos_complement
```

source code for print\_bits.c source code for print\_bits.h

## Code example: printing all 8 bit two's complement bit patterns

```
$ ./8_bit_twos_complement
-128 10000000
-127 10000001
-126 10000010
...
-3 11111101
-2 11111110
-1 11111111
0 00000000
1 00000001
2 00000010
3 00000011
...
125 01111101
126 01111110
127 01111111
```

COMP1521 23T3 – Integers

13 / 22

## Code example: printing bits of int

```
int a = 0;
printf("Enter an int: ");
scanf("%d", &a);
// sizeof returns number of bytes, a byte has 8 bits
int n_bits = 8 * sizeof a;
print_bits(a, n_bits);
printf("\n");
```

source code for print\_bits\_of\_int.c

```
$ dcc print_bits_of_int.c print_bits.c -o print_bits_of_int
$ ./print_bits_of_int
Enter an int: 42
00000000000000000000000000000000101010
$ ./print_bits_of_int
Enter an int: -42
111111111111111111111111010110
```

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 – Integers

14 / 22

## Code example: printing bits of int

```
$ ./print_bits_of_int
Enter an int: 0
00000000000000000000000000000000
$ ./print_bits_of_int
Enter an int: 1
00000000000000000000000000000001
$ ./print_bits_of_int
Enter an int: -1
11111111111111111111111111111111
$ ./print_bits_of_int
Enter an int: 2147483647
01111111111111111111111111111111
$ ./print_bits_of_int
Enter an int: -2147483648
10000000000000000000000000000000
$
```

COMP1521 23T3 – Integers

15 / 22

- Many hardware operations works with bytes: 1 byte == 8 bits
- C's **sizeof** gives you number of bytes used for variable or type
- sizeof variable** - returns number of bytes to store *variable*
- sizeof (type)** - returns number of bytes to store *type*
- On CSE servers, C types have these sizes
  - char** = 1 byte = 8 bits, 42 is 00101010
  - short** = 2 bytes = 16 bits, 42 is 0000000000101010
  - int** = 4 bytes = 32 bits, 42 is 0000000000000000000000000000101010
  - double** = 8 bytes = 64 bits, 42 = ?
- above are common sizes but not universal on a small embedded CPU  
**sizeof (int)** might be 2 (bytes)

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 – Integers

16 / 22

## Code example: `integer_types.c` - exploring integer types

We can use **sizeof** and **limits.h** to explore the range of values which can be represented by standard C integer types on our machine...

```
$ gcc integer_types.c -o integer_types
$ ./integer_types
      Type Bytes Bits
      char     1     8
signed char     1     8
unsigned char    1     8
      short     2    16
unsigned short   2    16
      int      4    32
unsigned int     4    32
      long     8    64
unsigned long    8    64
long long        8    64
unsigned long long 8    64
```

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 – Integers

17 / 22

## Code example: `integer_types.c` - exploring integer types

Type	Min	Max
char	-128	127
signed char	-128	127
unsigned char	0	255
short	-32768	32767
unsigned short	0	65535
int	-2147483648	2147483647
unsigned int	0	4294967295
long	-9223372036854775808	9223372036854775807
unsigned long	0	18446744073709551615
long long	-9223372036854775808	9223372036854775807
unsigned long long	0	18446744073709551615

source code for `integer_types.c`<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 – Integers

18 / 22

```
#include <stdint.h>
```

- to get below integer types (and more) with guaranteed sizes
- we will use these heavily in COMP1521

	<i>// range of values for type</i>	<i>minimum</i>	<i>maximum</i>
<code>int8_t i1; //</code>		-128	127
<code>uint8_t i2; //</code>		0	255
<code>int16_t i3; //</code>		-32768	32767
<code>uint16_t i4; //</code>		0	65535
<code>int32_t i5; //</code>		-2147483648	2147483647
<code>uint32_t i6; //</code>		0	4294967295
<code>int64_t i7; //</code>		-9223372036854775808	9223372036854775807
<code>uint64_t i8; //</code>		0	18446744073709551615

source code for stdint.c

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 – Integers

19 / 22

## Code example: char\_bug.c

Common C bug:

```
char c; // c should be declared int (int16_t would work, int is better)
while ((c = getchar()) != EOF) {
    putchar(c);
}
```

Typically stdio.h contains:

```
#define EOF -1
```

- most platforms: char is signed (-128..127)
  - loop will incorrectly exit for a byte containing 0xFF
- rare platforms: char is unsigned (0..255)
  - loop will never exit

source code for char\_bug.c

COMP1521 23T3 – Integers

20 / 22

## Endian-ness

- The bytes of a multi-byte (2 byte, 4 byte, ...) quantity can be stored in various orders.
- **Endian-ness** is the order.
- Two common orders: big-endian & little-endian
- **big-endian** - most significant byte at the smallest memory address.
- **little-endian** - least significant byte at the smallest memory address.
- Most modern general-purpose computers little-endian
- Endian-ness configurable on some architectures e.g ARM

<https://www.cse.unsw.edu.au/~cs1521/23T3/>

COMP1521 23T3 – Integers

21 / 22

## Testing Endian-ness

C

```
uint8_t b;
uint32_t u;
u = 0x03040506;
// load first byte of u
b = *(uint8_t *)&u;
// prints 6 if little-endian
// and 3 if big-endian
printf("%d\n", b);
```

source code for endian.c

MIPS

```
li    $t0, 0x03040506
la    $t1, u
sw    $t0, 0($t1) # u = 0x03040506;
lb    $a0, 0($t1) # b = *(uint8_t *)&u;
li    $v0, 1       # printf("%d", a0);
syscall
li    $a0, '\n'   # printf("%c", '\n');
li    $v0, 11
syscall
li    $v0, 0       # return 0
jr    $ra
.data
u:
.space 4
```

source code for endian.s
