

# COMP1521 24T3 – Integers

---

<https://www.cse.unsw.edu.au/~cs1521/24T3/>

# 10 types of students

There are only 10 types of students ...

- those that understand binary
- those that don't understand binary

- Can interpret decimal number 4705 as:

$$4 \times 10^3 + 7 \times 10^2 + 0 \times 10^1 + 5 \times 10^0$$

- The *base* or *radix* is 10 ... digits 0 – 9

- Place values:

...	1000	100	10	1
...	$10^3$	$10^2$	$10^1$	$10^0$

- Write number as  $4705_{10}$

- Note use of subscript to denote base

## Representation in Other Bases

- base 10 is an arbitrary choice
- can use any base
- e.g. could use base 7
- Place values:

$$\begin{array}{r} \dots & 343 & 49 & 7 & 1 \\ \hline \dots & 7^3 & 7^2 & 7^1 & 7^0 \end{array}$$

- Write number as  $1216_7$  and interpret as:

$$1 \times 7^3 + 2 \times 7^2 + 1 \times 7^1 + 6 \times 7^0 = 454_{10}$$

## Binary Representation

- Modern computing uses binary numbers
  - because digital devices can easily produce high or low level voltages which can represent 1 or 0.
- The *base* or *radix* is 2  
Digits 0 and 1
- Place values:

$$\begin{array}{r} \cdots & 8 & 4 & 2 & 1 \\ \cdots & 2^3 & 2^2 & 2^1 & 2^0 \end{array}$$

- Write number as  $1011_2$  and interpret as:  
 $1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 = 11_{10}$

## Converting between Binary and Decimal

- Example: Convert  $1101_2$  to Decimal:
- Example: Convert 29 to Binary:

## Hexadecimal Representation

- Binary numbers hard for humans to read – too many digits!
- Conversion to decimal awkward and hides bit values
- Solution: write numbers in hexadecimal!
- The *base* or *radix* is 16 ... digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F
- Place values:

...	4096	256	16	1
...	$16^3$	$16^2$	$16^1$	$16^0$

- Write number as  $3AF1_{16}$  and interpret as:  
$$3 \times 16^3 + 10 \times 16^2 + 15 \times 16^1 + 1 \times 16^0 = 15089_{10}$$
- in C, **0x** prefix denotes hexadecimal, e.g. **0x3AF1**

- Octal (based 8) representation used to be popular for binary numbers
- Similar advantages to hexadecimal
- in C a leading **0** denotes octal, e.g. **07563**
- binary constants were only recently added to C - some C compilers will not recognize them

```
printf("%d", 0x2A);      // prints 42
printf("%d", 052);       // prints 42
printf("%d", 0b101010); // might compile and print 42
```

# Binary Constants

In hexadecimal, each digit represents 4 bits

0100	1000	1111	1010	1011	1100	1001	0111	
0x	4	8	F	A	B	C	9	7

In octal, each digit represents 3 bits

01	001	000	111	110	101	011	110	010	010	111	
0	1	1	0	7	6	5	3	6	2	2	7

In binary, each digit represents 1 bit

0b01001000111110101011110010010111

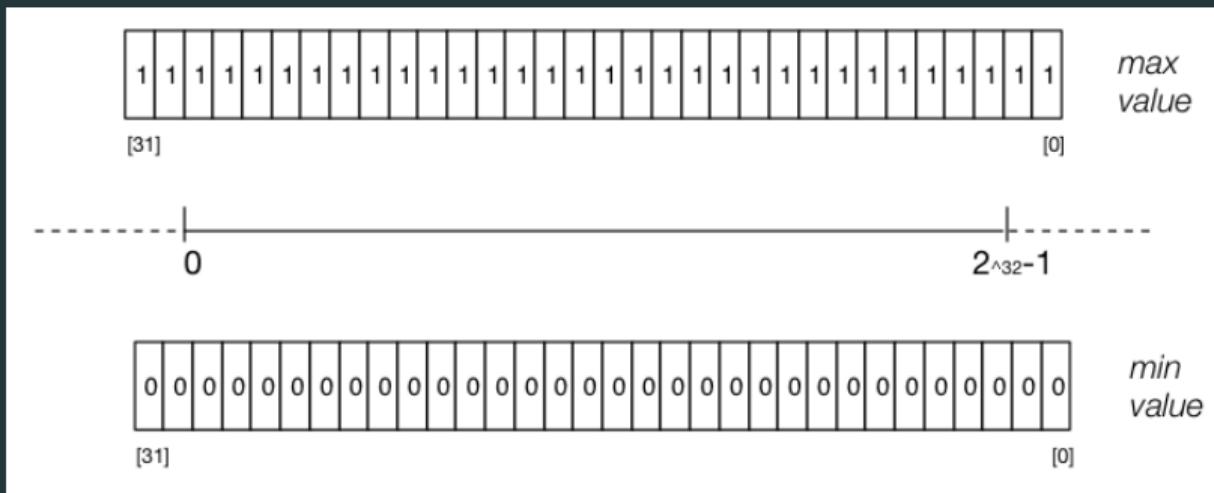

- Example: Convert  $1011111000101001_2$  to Hex:
- Example: Convert  $10111101011100_2$  to Hex:

- Reverse the previous process ...
- Convert each hex digit into equivalent 4-bit binary representation
- Example: Convert  $AD5_{16}$  to Binary:

# Unsigned integers

The `unsigned int` data type

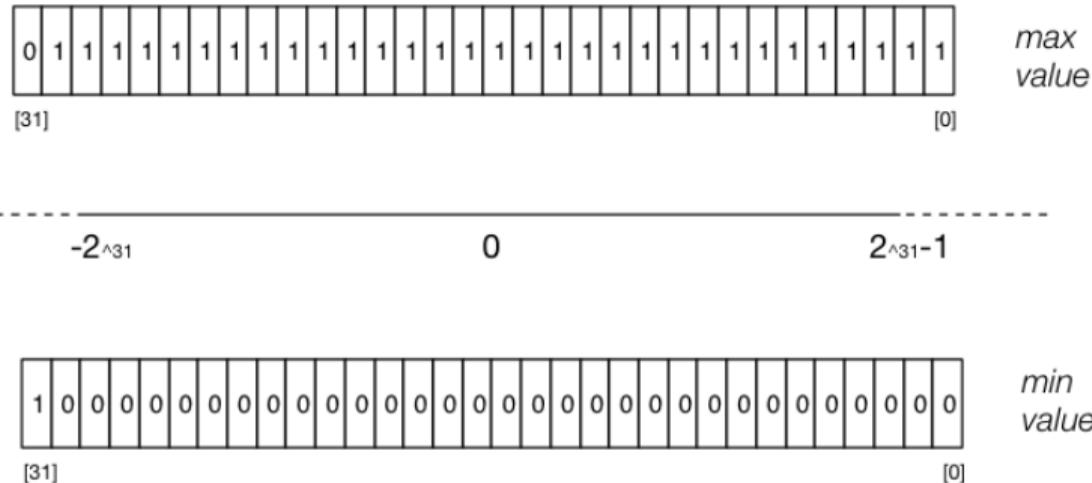

- on cse machines is 32 bits, storing values in the range  $0 .. 2^{32}-1$

# Signed integers

The `int` data type

- on cse machines is 32 bits, storing values in the range  $-2^{31} \dots 2^{31}-1$

- modern computers almost always use two's complement to represent integers
- positive integers and zero represented in obvious way
- negative integers represented in clever way to make arithmetic in silicon fast/simpler
- for an n-bit binary number the representation of  $-b$  is  $2^n - b$
- e.g. in 8-bit two's complement  $-5$  is represented as  $2^8 - 5 = 11111011_2$

## Code example: printing all 8 bit twos complement bit patterns

- Some simple code to examine all 8 bit twos complement bit patterns.

```
for (int i = -128; i < 128; i++) {  
    printf("%4d ", i);  
    print_bits(i, 8);  
    printf("\n");  
}
```

source code for 8\_bit\_twos\_complement.c

```
$ dcc 8_bit_twos_complement.c print_bits.c -o 8_bit_twos_complement
```

source code for print\_bits.c source code for print\_bits.h

## Code example: printing all 8 bit twos complement bit patterns

```
$ ./8_bit_twos_complement
```

```
-128 10000000
```

```
-127 10000001
```

```
-126 10000010
```

```
...
```

```
-3 11111101
```

```
-2 11111110
```

```
-1 11111111
```

```
0 00000000
```

```
1 00000001
```

```
2 00000010
```

```
3 00000011
```

```
...
```

```
125 01111101
```

```
126 01111110
```

```
127 01111111
```

## Code example: printing bits of int

```
int a = 0;
printf("Enter an int: ");
scanf("%d", &a);
// sizeof returns number of bytes, a byte has 8 bits
int n_bits = 8 * sizeof a;
print_bits(a, n_bits);
printf("\n");
```

source code for print\_bits\_of\_int.c

```
$ gcc print_bits_of_int.c print_bits.c -o print_bits_of_int
$ ./print_bits_of_int
```

Enter an int: 42

0000000000000000000000000000101010

```
$ ./print_bits_of_int
```

Enter an int: -42

11111111111111111111111111010110

## Code example: printing bits of int

```
$ ./print_bits_of_int
Enter an int: 0
00000000000000000000000000000000
$ ./print_bits_of_int
Enter an int: 1
00000000000000000000000000000001
$ ./print_bits_of_int
Enter an int: -1
11111111111111111111111111111111
$ ./print_bits_of_int
Enter an int: 2147483647
01111111111111111111111111111111
$ ./print_bits_of_int
Enter an int: -2147483648
10000000000000000000000000000000
$
```

- Many hardware operations works with bytes: 1 byte == 8 bits
- C's **sizeof** gives you number of bytes used for variable or type
  - **sizeof variable** - returns number of bytes to store *variable*
  - **sizeof (type)** - returns number of bytes to store *type*
- On CSE servers, C types have these sizes
  - **char** = 1 byte = 8 bits, 42 is 00101010
  - **short** = 2 bytes = 16 bits, 42 is 0000000000101010
  - **int** = 4 bytes = 32 bits, 42 is 00000000000000000000000000101010
  - **double** = 8 bytes = 64 bits, 42 = ?
- above are common sizes but not universal on a small embedded CPU  
**sizeof (int)** might be 2 (bytes)

## Code example: integer\_types.c - exploring integer types

We can use `sizeof` and `limits.h` to explore the range of values which can be represented by standard C integer types **on our machine**...

```
$ gcc integer_types.c -o integer_types  
$ ./integer_types
```

Type	Bytes	Bits
char	1	8
signed char	1	8
unsigned char	1	8
short	2	16
unsigned short	2	16
int	4	32
unsigned int	4	32
long	8	64
unsigned long	8	64
long long	8	64
unsigned long long	8	64

## Code example: integer\_types.c - exploring integer types

Type	Min	Max
char	-128	127
signed char	-128	127
unsigned char	0	255
short	-32768	32767
unsigned short	0	65535
int	-2147483648	2147483647
unsigned int	0	4294967295
long	-9223372036854775808	9223372036854775807
unsigned long	0	18446744073709551615
long long	-9223372036854775808	9223372036854775807
unsigned long long	0	18446744073709551615

source code for integer\_types.c

## stdint.h - integer types with guaranteed sizes

```
#include <stdint.h>
```

- to get below integer types (and more) with guaranteed sizes
- we will use these heavily in COMP1521

// range of values for type			
	//	minimum	maximum
int8_t	i1; //	-128	127
uint8_t	i2; //	0	255
int16_t	i3; //	-32768	32767
uint16_t	i4; //	0	65535
int32_t	i5; //	-2147483648	2147483647
uint32_t	i6; //	0	4294967295
int64_t	i7; //	-9223372036854775808	9223372036854775807
uint64_t	i8; //	0	18446744073709551615

source code for stdint.c

## Code example: char\_bug.c

Common C bug:

```
char c; // c should be declared int (int16_t would work, int is better)
while ((c = getchar()) != EOF) {
    putchar(c);
}
```

Typically `stdio.h` contains:

```
#define EOF -1
```

- most platforms: char is signed (-128..127)
  - loop will incorrectly exit for a byte containing 0xFF
- rare platforms: char is unsigned (0..255)
  - loop will never exit

source code for `char_bug.c`

- The bytes of a multi-byte (2 byte, 4 byte, ...) quantity can be stored in various orders.
- *Endian-ness* is the order.
- Two common orders: big-endian & little-endian
- *big-endian* - most significant byte at the smallest memory address.
- *little-endian* - least significant byte at the smallest memory address.
- Most modern general-purpose computers little-endian
- Endian-ness configurable on some architectures e.g ARM

# Testing Endian-ness

C

```
uint8_t b;  
uint32_t u;  
u = 0x03040506;  
// load first byte of u  
b = *(uint8_t *)&u;  
// prints 6 if little-endian  
// and 3 if big-endian  
printf("%d\n", b);
```

source code for endian.c

MIPS

```
lbu $a0, u      # b = *(uint8_t *)&u;  
li $v0, 1        # printf("%d", a0);  
syscall  
li $a0, '\n'    # printf("%c", '\n');  
li $v0, 11  
syscall  
li $v0, 0        # return 0  
jr $ra  
.data  
u:  
.word 0x3040506 #u = 0x03040506;
```

source code for endian.s
