## Selection Sort

Example

Implementation

Analysis

Properties

## Bubble Sort

## Insertion Sort

## Shell Sort

## Summary

## Sorting Lists

## Appendix

**Method:**

- Find the smallest element, swap it with the first element
- Find the second-smallest element, swap it with the second element
- ...
- Find the second-largest element, swap it with the second-last element

Each iteration improves the “sortedness” of the array by one element.

Properties

Bubble Sort

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

### Cost analysis:

- In the first iteration,  $n - 1$  comparisons, 1 swap
- In the second iteration,  $n - 2$  comparisons, 1 swap
- ...
- In the final iteration, 1 comparison, 1 swap
- $C = (n - 1) + (n - 2) + \dots + 1 = \frac{1}{2}n(n - 1) \Rightarrow O(n^2)$
- $S = n - 1$

Cost is the same, regardless of the sortedness of the original array.

Sorting Lists

Appendix

### **Unstable**

Due to long-range swaps

### **Non-adaptive**

Performs same steps, regardless of sortedness of original array

### **In-place**

Sorting is done within original array; does not use temporary arrays

Selection Sort

**Bubble Sort**

Example

Implementation

Analysis

Properties

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

## Method:

- Make multiple passes from left (lo) to right
- On each pass, swap any out-of-order adjacent pairs
- Elements “bubble up” until they meet a larger element
- Stop if there are no swaps during a pass
  - This means the array is sorted

Selection Sort

Bubble Sort

Example

Implementation

Analysis

Properties

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

Average-case time complexity:  $O(n^2)$

- It can be proven that for a randomly ordered array, bubble sort needs to perform  $\frac{1}{4}n(n-1)$  swaps on average  $\Rightarrow O(n^2)$ 
  - See appendix for details
- Can show empirically by generating random sequences and sorting them

Selection Sort

Bubble Sort

Example

Implementation

Analysis

Properties

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

## Stable

Comparisons are between adjacent elements only  
Elements are only swapped if out of order

## Adaptive

Bubble sort is  $O(n^2)$  on average,  $O(n)$  if input array is sorted

## In-place

Sorting is done within original array; does not use temporary arrays

Selection Sort

Bubble Sort

**Insertion Sort**Example  
Implementation  
Analysis  
Properties

Shell Sort

Summary

Sorting Lists

Appendix

## Method:

- Take first element and treat as sorted array (of length 1)
- Take next element and insert into sorted part of array so that order is preserved
  - This increases the length of the sorted part by one
- Repeat for remaining elements

## Idea:

- An array is  $h$ -sorted if taking every  $h$ -th element yields a sorted array
- An  $h$ -sorted array is made up of  $\frac{n}{h}$  interleaved sorted arrays
- Shell sort:  $h$ -sort the array for progressively smaller  $h$ , ending with  $h = 1$

Insertion Sort

Shell Sort

Example  
Implementation

Analysis

Properties

Summary

Sorting Lists

Appendix

- Efficiency of shell sort depends on the  $h$ -sequence
- Effective  $h$ -sequences have been determined empirically
- Many  $h$ -sequences have been found to be  $O(n^{\frac{3}{2}})$ 
  - For example: 1, 4, 13, 40, 121, 364, 1093, ...
    - $h_{i+1} = 3h_i + 1$
- Some  $h$ -sequences have been found to be  $O(n^{\frac{4}{3}})$ 
  - For example: 1, 8, 23, 77, 281, 1073, 4193, ...

Shell sort	depends	depends	depends	No	Yes

### Selection sort:

- Let  $L =$  original list,  $S =$  sorted list (initially empty)
- Repeat the following until  $L$  is empty:
  - Find the node  $V$  containing the largest value in  $L$ , and unlink it
  - Insert  $V$  at the front of  $S$

### Bubble sort:

- Traverse the list, comparing adjacent values
  - If value in current node is greater than value in next node, swap values
- Repeat the above until no swaps required in one traversal

### Insertion sort:

- Let  $L =$  original list,  $S =$  sorted list (initially empty)
- For each node in  $L$ :
  - Insert the node into  $S$  in order

Selection Sort

Bubble Sort

Insertion Sort

Shell Sort

Summary

Sorting Lists

Bubble sort average  
case

# Appendix

Selection Sort

Bubble Sort

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

Bubble sort average  
caseNew concept: **inversion**

An inversion is a pair of elements from a sequence where the left element is greater than the right element.

For example, consider the following array:

4	2	1	5	3
---	---	---	---	---

The array contains 5 inversions:

$(4, 2)$ ,  $(4, 1)$ ,  $(4, 3)$ ,  $(2, 1)$ ,  $(5, 3)$

Selection Sort

Bubble Sort

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

Bubble sort average  
case

### Observation:

- In bubble sort, every swap reduces the number of inversions by 1

The goal of the proof: Show that the average number of inversions in a randomly sorted array is  $O(n^2)$ .

- This implies the number of swaps required by bubble sort is  $O(n^2)$  ...
- Which implies that the average-case time complexity of bubble sort is  $O(n^2)$  or slower
  - (but we know that it can't be slower than  $O(n^2)$  since the worst-case time complexity of bubble sort is  $O(n^2)$ )

Selection Sort

Bubble Sort

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

Bubble sort average  
case

In a randomly sorted array:

- The minimum possible number of inversions is 0 (sorted array)
- The maximum possible number of inversions is  $\frac{1}{2}n(n-1)$  (reverse-sorted array)

Let  $k$  be the number of inversions in a random permutation.

By reversing this permutation, one can obtain a permutation with  $\frac{1}{2}n(n-1) - k$  inversions.

For example, suppose  $n = 5$ :

Selection Sort

Bubble Sort

Insertion Sort

Shell Sort

Summary

Sorting Lists

Appendix

Bubble sort average  
case

Thus, if we take all the possible permutations of an array and pair each permutation with its reverse, the total number of inversions in each pair is  $\frac{1}{2}n(n-1)$ .

This implies that the average number of inversions across all permutations is  $\frac{1}{4}n(n-1)$ , which is  $O(n^2)$ .
