Directed Graphs (Digraphs)

COMP2521 25T2

Traversal

Cycle Checking

Transitive Closure

Other Algorithms

Reminder: directed graphs are graphs where...

- Each edge (v, w) has a source v and a destination w
- Unlike undirected graphs, $v \rightarrow w \neq w \rightarrow v$

Digraph Applications

Traversal

COMP2521 25T2

Cycle Checking

Transitive Closure

Other Algorithms

application	vertex is	edge is
WWW	web page	hyperlink
chess	board state	legal move
scheduling	task	precedence
program	function	function call
journals	article	citation
make	target	dependency

Traversal Application

Cycle Checking

Transitive Closure

Other Algorithms

Same as for undirected graphs:

```
bfs(G, src):
    initialise visited array
    mark src as visited
    enqueue src into Q
    while Q is not empty:
        v = dequeue from Q
        for each edge (v, w) in G:
            if w has not been visited:
            mark w as visited
            enqueue w into Q
```

dfs(G, src):
 initialise visited array
 dfsRec(G, src, visited)

dfsRec(G, v, visited):
 mark v as visited
 for each edge (v, w) in G:
 if w has not been visited:
 dfsRec(G, w, visited)

Digraph Traversal

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Traversal Application

Cycle Checking

Transitive Closure

Other Algorithms

Web crawling

Visit a subset of the web... ...to index ...to cache locally

Which traversal method? BFS or DFS?

Note: we can't use a visited array, as we don't know how many webpages there are. Instead, use a visited set.

Transitive Closure

Other Algorithms

```
Web crawling algorithm:
```

```
webCrawl(startingUrl, maxPagesToVisit):
    create visited set
    add startingUrl to visited set
    enqueue startingUrl into Q
```

```
numPagesVisited = 0
while Q is not empty and numPagesVisited < maxPagesToVisit:
    currPage = dequeue from Q</pre>
```

```
visit currPage
numPagesVisited = numPagesVisited + 1
```

for each hyperlink on currPage:
 if hyperlink not in visited set:
 add hyperlink to visited set
 enqueue hyperlink into Q

Cycle Checking

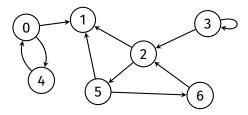

Traversal

Cycle Checking

Pseudocode Example

Transitive Closure

Other Algorithms In directed graphs, a cycle is a directed path where the start vertex = end vertex

This graph has three distinct cycles: 0-4-0, 2-5-6-2, 3-3

・ロト・日本・日本・日本・日本・日本

Traversal

Cycle Checking

Pseudocode Example

Transitive Closure

Other Algorithms

Recall: Cycle checking for undirected graphs:

```
hasCycle(G):
    initialise visited array to false
    for each vertex v in G:
        if visited[v] = false:
            if dfsHasCycle(G, v, v, visited):
                return true
```

return false

```
dfsHasCycle(G, v, prev, visited):
    visited[v] = true
```

Does this work for directed graphs?

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

```
for each edge (v, w) in G:
    if w = prev:
        continue
    if visited[w] = true:
        return true
    else if dfsHasCycle(G, w, v, visited):
        return true
```

return false

Traversal

Cycle Checking

Pseudocode Example

Transitive Closure

Other Algorithms

Recall: Cycle checking for undirected graphs:

```
hasCycle(G):
    initialise visited array to false
    for each vertex v in G:
        if visited[v] = false:
            if dfsHasCycle(G, v, v, visited):
                return true
```

return false

```
dfsHasCycle(G, v, prev, visited):
    visited[v] = true
```

```
for each edge (v, w) in G:
    if w = prev:
        continue
    if visited[w] = true:
        return true
    else if dfsHasCycle(G, w, v, visited):
        return true
```

Does this work for directed graphs?

No

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

```
return false
```

Pseudocode Example

Transitive Closure

Other Algorithms

▲ロト ▲ 同 ト ▲ 三 ト ▲ 三 ト つ Q ()

Problem #1

Algorithm ignores edge to previous vertex and therefore does not detect the following cycle:

Simple fix: Don't ignore edge to previous vertex

Traversal

Cycle Checking

Pseudocode Example

Transitive Closure

Other Algorithms

```
hasCycle(G):
    initialise visited array to false
    for each vertex v in G:
        if visited[v] = false:
            if dfsHasCycle(G, v, visited):
                return true
```

return false

```
dfsHasCycle(G, v, visited):
    visited[v] = true
```

```
for each edge (v, w) in G:
    if visited[w] = true:
        return true
    else if dfsHasCycle(G, w, visited):
        return true
```

return false

Does this work for directed graphs?

```
▲□▶▲□▶▲□▶▲□▶ □ ● ○ ○ ○
```

Traversal

Cycle Checking

Pseudocode Example

Transitive Closure

Other Algorithms

```
hasCycle(G):
    initialise visited array to false
    for each vertex v in G:
        if visited[v] = false:
            if dfsHasCycle(G, v, visited):
                return true
```

return false

```
dfsHasCycle(G, v, visited):
    visited[v] = true
```

```
for each edge (v, w) in G:
    if visited[w] = true:
        return true
    else if dfsHasCycle(G, w, visited):
        return true
```

Does this work for directed graphs?

No!

return false

<ロト < 団 ト < 三 ト < 三 ト 三 のへで</p>

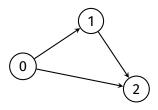

Pseudocode Example

Transitive Closure

Other Algorithms

Problem #2

Algorithm can detect cycles when there is none, for example:

Algorithm starts at 0, recurses into 1 and 2, backtracks to 0, sees that 2 has been visited, and concludes there is a cycle

Cycle Checking

Pseudocode Example

Transitive Closure

Other Algorithm

Cycle Checking

Idea:

To properly detect a cycle, check if neighbour is already on the call stack

When the graph is undirected, this can be done by checking the visited array, but this doesn't work for directed graphs!

Need to use separate array to keep track of when a vertex is on the call stack

Cycle Checking Pseudocode

Traversal

Problem: computing reachability

Given a digraph G it is potentially useful to know:

• Is vertex *t* reachable from vertex *s*?

▲□▶▲□▶▲□▶▲□▶ ▲□▶ ▲□

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Traversal

COMP2521 25T2

Cycle Checking

Transitive Closure Warshall's algorithm

Other Algorithms

One way to implement a reachability check:

- Use BFS or DFS starting at s
 - This is O(V + E) in the worst case
 - Only feasible if reachability is an infrequent operation

What about applications that frequently need to check reachability?

◆□▶ ◆□▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Traversal

COMP2521 25T2

Cycle Checking

Transitive Closure

Warshall's algorithm

Other Algorithms

Idea

Construct a $V \times V$ matrix that tells us whether there is a path (not edge) from s to t, for $s, t \in V$

This matrix is called the transitive closure (tc) matrix (or reachability matrix)

tc[s][t] is true if there is a path from s to t, false otherwise

Other Algorithms

Analysis:

- Time complexity: $O(V^3)$
 - Three nested loops iterating over all vertices
- Space complexity: $O(V^2)$
 - Can be O(1) if overwriting the input matrix
- Benefit: checking reachability between vertices is now O(1)
 - Makes up for slow setup ($O(V^3)$) if reachability is a very frequent operation
