assorted problems

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted Problems](#)[Demo: Python Dictionaries](#)

A hash table is a data structure that stores key-value pairs,
where keys are unique

jas ⇒ green	andrew ⇒ red
sasha ⇒ purple	
kevin ⇒ blue	jake ⇒ yellow
hayden ⇒ red	

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted Problems](#)[Demo: Python Dictionaries](#)

Operations

Insert: Insert or replace key-value pair

Lookup: Given a key, get its associated value

Delete: Given a key, delete its key-value pair

Performance

Average-case: $O(1)$

Assuming good hash function and appropriate resizing

Worst-case: $O(n)$

If all keys hash to the same value (extremely unlikely with good hash)

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Demo: Python
Dictionaries](#)

Hash tables are used everywhere
due to their efficiency

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Demo: Python
Dictionaries](#)

A set is an unordered collection of distinct elements

Operations

Insert: Insert an item into the set

Membership: Check if an item is in the set

Delete: Delete an item from the set

Recap

Set ADT

Counter ADT

Assorted
ProblemsDemo: Python
Dictionaries

```
/** Creates a new empty set */
Set SetNew(void);

/** Free memory used by set */
void SetFree(Set set);

/** Inserts an item into the set */
void SetInsert(Set set, int item);

/** Checks if an item is in the set */
bool SetContains(Set set, int item);

/** Deletes an item from the set */
void SetDelete(Set set, int item);

/** Returns the size of the set */
int SetSize(Set set);

/** Displays the set */
void SetShow(Set set);
```

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted Problems](#)[Demo: Python Dictionaries](#)

How to implement the Set ADT using a hash table?

Insert

Insert item into the hash table as a key

Can use anything as the value

Contains

Check if the item exists in the hash table

Delete

Delete the item from the hash table

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Demo: Python
Dictionaries](#)

A counter is a collection of items where each distinct item has a count

Operations

Add: Add one to the count of an item
Get: Get the count of an item

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Demo: Python
Dictionaries](#)

```
/** Creates a new empty counter */
Counter CounterNew(void);

/** Free memory used by counter */
void CounterFree(Counter c);

/** Add one to the count of an item */
void CounterAdd(Counter c, int item);

/** Get the count of an item */
int CounterGet(Counter c, int item);
```

How to implement the Counter ADT using a hash table?

Use hash table to map **items** to their **counts**

Add

Look up item's count in the hash table
Then re-insert the item into the hash table
with count increased by 1

Get

Look up item's count in the hash table

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted Problems](#)[Demo: Python Dictionaries](#)

Data Structure	Add	Get
Unordered array	$O(n)$	$O(n)$
Ordered array	$O(n)$	$O(\log n)$
AVL tree	$O(\log n)$	$O(\log n)$
Hash table*	$O(1)$	$O(1)$

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Two sum](#)[Odd occurring](#)[Anagram](#)[Demo: Python
Dictionaries](#)

Hash tables are often used as sets or counters
to solve problems efficiently

Examples

Two sum

Odd occurring elements

Anagram

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted Problems](#)[Two sum](#)[Odd occurring](#)[Anagram](#)[Demo: Python Dictionaries](#)

Problem

Given an array of integers and a target sum S , determine whether the array contains two integers that sum to S .

Examples

Consider the array $A = [12, 6, 3, 3, 7, 8]$

`twoSum(A, 13) ⇒ true`

`twoSum(A, 16) ⇒ false`

`twoSum(A, 3) ⇒ false`

`twoSum(A, 6) ⇒ true`

Problem

Given an array of integers,
return the number of distinct integers that
occur an odd number of times.

Examples

`oddOccurring([4, 3, 4, 8, 8, 4])` \Rightarrow 2

`oddOccurring([7, 2, 1, 5, 6, 9])` \Rightarrow 6

`oddOccurring([1, 1, 3, 3, 7, 7])` \Rightarrow 0

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Two sum](#)[Odd occurring](#)[Anagram](#)[Demo: Python
Dictionaries](#)

Problem

Given two strings s and t ,
determine whether they are anagrams.

Two strings are anagrams if they contain
the same amount of each character.

Examples

```
anagram("abcde", "edcba") => true
anagram("abcde", "fdcba") => false
anagram("abcde", "abcdef") => false
anagram("aaabb", "ababa") => true
anagram("aaabb", "babab") => false
```

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted
Problems](#)[Demo: Python
Dictionaries](#)

Bonus content!

Python has built-in syntax for hash tables,
which are called **dictionaries**.

[Recap](#)[Set ADT](#)[Counter ADT](#)[Assorted Problems](#)[Demo: Python Dictionaries](#)

Operations

Create a dictionary

```
my_dictionary = {}
```

Insert a key-value pair

```
my_dictionary[key] = value
```

Check if a key exists

```
key in my_dictionary
```

Get the value associated with a key

```
my_dictionary[key]
```

Delete a key-value pair

```
del my_dictionary[key]
```
