bfs and dfs path checking path finding

BFS

Ideas/Issues

Appendix

Common problems on graphs:

- Is there a path between two vertices?
- What is the shortest path between two vertices?
- Which vertices are reachable from a particular vertex?
- Is the graph connected?
- Is there a cycle?
- How many connected components are there?
- Is there a simple path/cycle that passes through all vertices?

Graph Traversal BFS and DFS

BFS and I

DFS

Ideas/Issues

Appendix

All of the above problems can be solved by a systematic exploration of a graph via its edges.

This systematic exploration is called traversal or search.

Traversal

DES

Ideas/Issues

Appendix

Two primary methods for graph traversal/search:

Breadth-first search (BFS)

- Prioritises exploring widely over exploring deeply
 - "Go wide"
- Implemented iteratively (using a queue)

Depth-first search (DFS)

- Prioritises exploring deeply over exploring widely
 - "Go deep"
- Implemented recursively or iteratively (using a stack)

BFS vs. DFS in a tree

Graph Traversal BFS and DFS

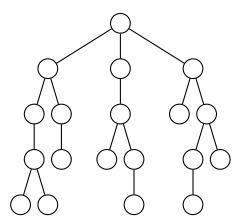

DFS

Ideas/Issues

Appendix

In what order would BFS and DFS visit the nodes of this tree?

(Assume that nodes towards the left have higher priority)

BFS vs. DFS in a tree

BFS vs. DFS in a graph

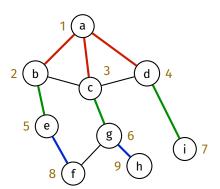

Graph Traversal BFS and DFS

BFS DFS

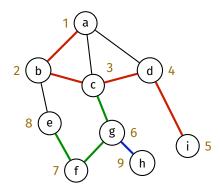

Ideas/Issues

Appendix

Breadth-first search

Depth-first search

BFS

Pseudocode Analysis Path Finding

DFS

Ideas/Issues

Appendix

Breadth-first search visits vertices in order of distance from the starting vertex.

BFS is implemented iteratively using a queue.

Data structures

Graph Traversal

BFS Example

Pseudocod Analysis Path Findin

DFS

Ideas/Issues

Appendix

Data structures used in BFS:

- Visited array
 - To keep track of which vertices have been visited
- Predecessor array
 - To keep track of the predecessor of each vertex
 - The predecessor of v is the vertex from which we reached v
 - i.e., the vertex before v on the path to v
- Queue
 - First-in-first-out data structure
 - Stores unvisited vertices in the order that they should be visited

Algorithm

Graph Traversal

Example

Pseudocode Analysis Path Finding

DFS

Ideas/Issues

Appendix

Algorithm:

- 1 Create/initialise data structures:
 - Create visited array, initialised to false
 - Create predecessor array, initialised to -1
 - Create empty queue
- Mark starting vertex as visited and enqueue it
- 3 While the queue is not empty:
 - 1 Dequeue a vertex
 - Let this vertex be v
 - **2 Explore** v that is, for each of v's unvisited neighbours:
 - 1 Mark it as visited
 - 2 Set its predecessor to v
 - 3 Enqueue it

Graph
Traversal
BFS
```

Pseudocode Analysis

Path Findin

Ideas/Issues

Appendix

```
bfs(G, src):
    Input: graph G, starting vertex src
    create predecessor array, initialised to -1
    create queue Q
    predecessor[src] = src // <- mark src as visited
    enqueue src into Q
    while Q is not empty:
        v = dequeue from Q
        for each neighbour w of v in G where predecessor[w] = -1:
            predecessor[w] = v
            enqueue w into \mathcal{Q}
```

BFS Example

Pseudoco

Path Findi

Path Findi

Ideas/Issues

Appendix

BFS is O(V + E) when using the adjacency list representation:

- Typical queue implementation has O(1) enqueue and dequeue
- Each vertex is visited at most once $\Rightarrow O(V)$
- ullet For each vertex, all of its edges are considered once $\Rightarrow O(E)$

BFS

Pseudoco

Analysis

Path Finding

DFS

Ideas/Issues

Appendix

A BFS finds the shortest path between the starting vertex and all other vertices.

Shortest path in terms of the number of edges

The shortest path between src and dest can be found by tracing backwards through the predecessor array (from dest to src).

if predecessor[dest] \neq -1:

v = dest

while v \neq src:

print v, "<-"

v = predecessor[v]

print src
```

BFS

DFS

Recursivo

Ideas/Issues

Appendix

Depth-first search goes as far down one path as possible until it reaches a dead end, then backtracks until it finds a new path to take, then repeats

DFS can be implemented recursively or iteratively.

Recursive Depth-First Search

Graph Traversal

BFS

Recurs

Pseudocode Example Analysis Path checking Path finding

Ideas/Issues

Appendix

Depth-first search is described recursively as:

- Mark current vertex as visited
 - The first time, this is the starting vertex
- 2 For each neighbour of the current vertex:
 - If it has not been visited:
 - Recursively traverse starting from that vertex

The recursion naturally induces backtracking.

BFS

Recursive

Pseudocod

Analysis

Path findin

Ideas/Issues

Appendix

Recursive DFS is O(V + E) when using the adjacency list representation:

- Each vertex is visited at most once $\Rightarrow O(V)$
 - Function is called on each vertex at most once
- For each vertex, all of its edges are considered once $\Rightarrow O(E)$

Path-Checking with Recursive DFS

Graph Traversal

BFS

Recursive

Pseudocod Example

Path checking

Path finding

Ideas/Issues

Appendix

Recursive DFS can be adapted to check if a path exists between two vertices.

Idea:

- To check if a path exists between *src* and *dest*:
 - If src = dest, then there is a path (the empty path)
 - ullet Otherwise, for each neighbour of src, recursively check if there is a path from that neighbour to dest

BFS

DFS Recursive

Pseudocod

Iterative Depth-First Search

Graph Traversal

BFS

DFS

Iterative

Analysi

Ideas/Issues

Appendix

DFS can be implemented iteratively.

Iterative DFS is similar to BFS, but there are a few crucial differences:

- DFS uses a stack instead of a queue
- DFS marks a vertex as visited after removing it from the stack, not when adding it (which is what BFS does, but with a queue)

Iterative Depth-First Search

Pseudocode

```
Traversal
            dfs(G, src):
BFS
                Input: graph G, vertex src
                create visited array, initialised to false
Pseudocode
Analysis
                create predecessor array, initialised to -1
Ideas/Issues
                create stack S
Appendix
                push src onto S
                while S is not empty:
                     v = pop from S
                     if visited[v] = true:
                         continue // i.e., return to start of loop
                     visited[v] = true
                     for each neighbour w of v in G where visited \lceil w \rceil = \text{false}:
                         predecessor[w] = v
                         push w onto S
```
