#### **Natural Deduction and Rule Induction**

Thomas Sewell UNSW Term 3 2024

Ambiguity

Simultaneous Induction

# **Some Announcements**

Material from current & future lectures will appear on the website.

- Includes bonus material like Liam's preliminaries exercises.
- We'll try to do this before the lectures in future.

Assignment 0 will appear later this week.

• Some parts will cover future material; more on that later.

We've talked a lot about induction.

- Johannes' justification
  - $\bullet\,$  In Rose tree notes I accidentally included from last year.
- Thomas' justification
  - Nearly all theory/proof work involves tricky induction.
- Today we'll connect this to program syntax.

Rule Induction

Ambiguity 000000000 Simultaneous Induction

## Formalisation

To talk about languages in a mathematically precise way, we need to formalise them.

#### Formalisation

*Formalisation* is the process of giving a language a formal, mathematical description.

Typically, we describe the language in another language, called the *meta-language*. For implementations, it may be a programming language such as Haskell. For formalisations it is usually a minimal logic called a *meta-logic*.

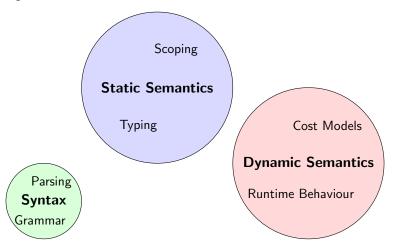

Admin O Natural Deduction

Rule Induction

Ambiguity 000000000 Simultaneous Induction

# Learning from History

What sort of meta logic should we use? There are a number of things to formalise:

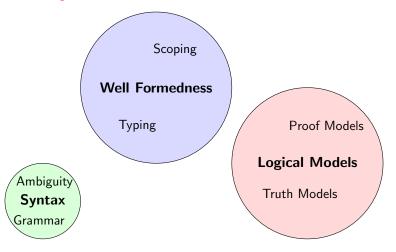

Admin O Natural Deduction

Rule Induction

Ambiguity 000000000 Simultaneous Induction

# Learning from History

Logicians in the early 20th century had much the same desire to formalise *logics*.

Ambiguity

Simultaneous Induction

# Learning from History

In this course, we will use a meta-logic based on *Natural Deduction* and inductive inference rules, originally invented for formalising logics by Gerhard Gentzen in the mid 1930s.

### Der Kalkül des natürlichen Schließens.

A B	A & B	A&B	
A&B	A	B	

Ambiguity

Simultaneous Induction

### **Judgements**

A *judgement* is a statement asserting a certain property for an object.

### Example (Informal Judgements)

- $3 + 4 \times 5$  is a valid arithmetic expression.
- The string *madam* is a palindrome.
- The string *snooze* is a palindrome
  - $\implies$  Judgements do not have to hold.

#### **Unary Judgements**

Formally, we denote the judgement that a property **A** holds for an object s by writing s **A**.

Typically, s is a string when describing syntax, and s is a term when describing semantics.

Rule Induction

Ambiguity

Simultaneous Induction

# **Proving Judgements**

We define how a judgement may be proven by providing a set of *inference rules*.

**Inference Rules** 

An inference rule is written as:

$$\frac{J_1 \quad J_2 \quad \dots \quad J_n}{J}$$

This states that in order to prove judgement J (the *conclusion*), it suffices to prove all judgements  $J_1$  through to  $J_n$  (the *premises*).

Rules with no premises are called *axioms*. Their conclusions always hold.

Rule Induction

Ambiguity 000000000 Simultaneous Induction

### **Examples**

n Nat

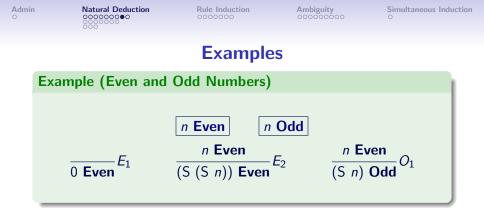

0 is a natural number

if n is a natural number, then the successor of nis a natural number.

What terms are in the set  $\{n \mid n \text{ Nat}\}$ ?

 $\{0, (S 0), (S (S 0)), (S (S (S 0))), \dots \}$ 

#### The Proof Video Game

To show that a judgement  $s \land A$  holds:

- **1** Find a rule whose conclusion matches *s* **A**.
- The preconditions of the applied rules become new proof obligations.
- **③** Rinse and repeat until all obligations are proven up to axioms.

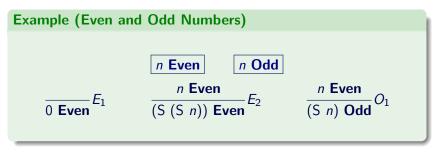

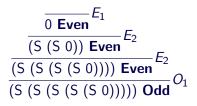

Rule Induction

Ambiguity

Simultaneous Induction

### **Examples**

Ambiguity

Simultaneous Induction

# **Defining Languages**

Example (Bracket Matching Language)

 $\mathbf{M} ::= \varepsilon \mid \mathbf{MM} \mid (\mathbf{M})$ 

Examples of strings:  $\varepsilon$ , (), (()), ()(), (()()), ...

Three rules:

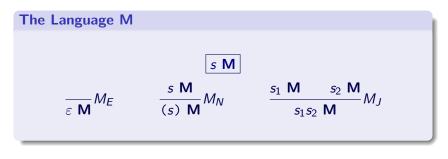

AxiomThe empty string is in MJuxtapositionAny two strings in M can be concatenated<br/>to give a new string in MNestingAny string in M can be surrounded by<br/>parentheses, giving a new string in M

Rule Induction

Ambiguity 000000000 Simultaneous Induction

### With Rules

Rule Induction

Ambiguity

Simultaneous Induction

# **Getting Stuck**

If we had started with rule  $M_N$  instead, we would have gotten stuck:

 $\frac{\frac{???}{() () M}}{() (()) M} M_N$ 

#### Takeaway

Getting stuck does not mean what you're trying to prove is false!

Rule Induction

Ambiguity

Simultaneous Induction

### Derivability

Consider the following rule:

### s M ((s)) M

Does adding this rule change M? (i.e. is it not *admissible* to M)? No, because we could always use rule  $M_N$  twice instead. Rules that are compositions of existing rules are called *derivable*:

$$\frac{\frac{s \mathbf{M}}{(s) \mathbf{M}} M_N}{((s)) \mathbf{M}} M_N$$

We can prove rules as well as judgements, by deriving the conclusion of the rule while taking the premises as local axioms.

Rule Induction

Ambiguity

Simultaneous Induction

### Derivability

Is this rule derivable?

 $\frac{s M}{(s)s M}$ 

We can derive it like so:

$$\frac{\overline{s \mathbf{M}}}{(s) \mathbf{M}} M_N \qquad \overline{s \mathbf{M}} M_J$$

Rule Induction

Ambiguity

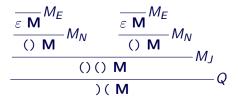

Simultaneous Induction

### Derivability

Is this rule derivable?

It is not admissible, let alone derivable, as it adds strings to M:

Rule Induction

Ambiguity 000000000 Simultaneous Induction

## Derivability

Is this rule admissible? If so, is it derivable?

()s M s M

- It is admissible, as it doesn't let us prove any new judgements about **M**.
- It is not derivable, as it is not made up of the composition of existing rules.
- We will see how to prove these sorts of rules are admissible later on.

Ambiguity

Simultaneous Induction

# **Hypothetical Derivations**

We can write a rule in a horizontal format as well:

$$\frac{A}{B}$$
 is the same as  $A \vdash B$ 

This allows us to neatly make rules premises of other rules, called *hypothetical derivations*:

Example

$$\frac{A \vdash B}{C}$$

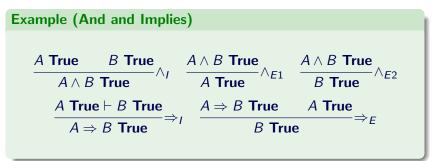

Read as: If assuming A we can derive B, then we can derive C.

Ambiguity 000000000 Simultaneous Induction

# **Specifying Logic**

With hypotheticals we can specify logic, which was the original purpose of natural deduction. Let A **True** be the judgement that the proposition A is true.

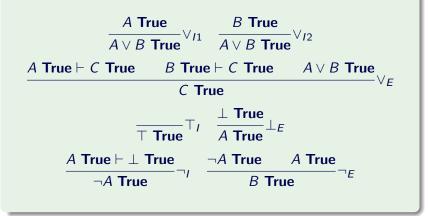

Ambiguity 000000000 Simultaneous Induction

# Specifying Logic, Continued

Example (Or, True, False and Not)

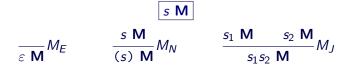

Rule Induction

Ambiguity

Simultaneous Induction

### **Minimal Definitions**

The above rules are the smallest set of rules to define every string in  $\mathbf{M}$ .

#### Therefore

If we know that a string satisfies  $s \, M$ , it must have been through a (finite) derivation using these rules.

This is called an *inductive definition* of **M**.

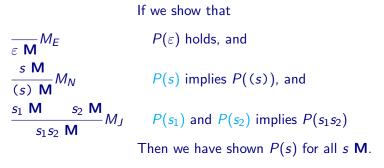

Rule Induction

Ambiguity

Simultaneous Induction

## **Rule Induction**

Suppose we want to show that a property P(s) of strings s holds for any string s **M**. We will use *rule induction*.

These assumptions are called *inductive hypotheses*.

Rule Induction

Ambiguity

Simultaneous Induction

### **Rule Induction**

#### **Example (Counting Parens)**

Let op(s) denote the number of opening parentheses in s, and cl(s) denote the number of closing parentheses. We shall prove that

$$s \mathbf{M} \implies op(s) = cl(s)$$

by doing rule induction on s **M**.

Admin O Natural Deduction

Rule Induction

Ambiguity

Simultaneous Induction

### **Rule Induction**

**Example (Counting Parens)** 

 $\frac{\overline{\varepsilon \mathbf{M}}^{M_E}}{\frac{s \mathbf{M}}{(s) \mathbf{M}}} M_N$ 

 $\frac{s_1 \mathbf{M} s_2 \mathbf{M}}{s_1 s_2 \mathbf{M}} M_J$ 

**Base Case:**  $op(\varepsilon) = 0 = cl(\varepsilon)$ 

Inductive Case: Assuming I.H:

op(s) = cl(s)op((s)) = op(s) + 1 = cl(s) + 1 = cl((s))

Inductive Case: Assuming I.Hs:

 $op(s_1) = cl(s_1)$  and  $op(s_2) = cl(s_2)$  $op(s_1s_2) = op(s_1) + op(s_2) = cl(s_1s_2)$ 

Ambiguity 000000000 Simultaneous Induction

## **Rule Induction in General**

#### **Rule Induction Method**

Given a set of rules R, we may prove a property P inductively for all judgements that can be inferred with R by showing, for each rule of the form

$$\frac{J_1 \quad J_2 \quad \dots \quad J_n}{J}$$

that if P holds for each of  $J_1 \dots J_n$ , then P holds for J.

Therefore, axioms are the base cases of the induction, all other rules form inductive cases, and the premises of each rule give rise to inductive hypotheses.

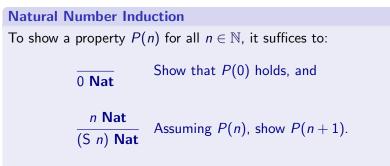

Rule Induction

Ambiguity

Simultaneous Induction

# **Structural Induction**

Conventional *structural induction* such as that on natural numbers, which we have encountered before, is a special case of rule induction.

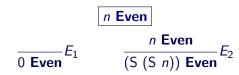

Rule Induction

Ambiguity

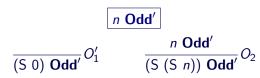

Simultaneous Induction

### **Another Example**

Recall our definition of even numbers:

We could define odd numbers differently:

Let's prove the original **Odd** rule, but for **Odd**' (to "whiteboard"):

 $\frac{n \text{ Even}}{(S n) \text{ Odd}'}$ 

Rule Induction

Ambiguity • 00000000 Simultaneous Induction

### Arithmetic

We can infer  $1 + 2 \times 3$  **Arith** in two different ways.

Rule Induction

Ambiguity

Simultaneous Induction

# Ambiguity

**Arith** is *ambiguous*, which means that there are multiple ways to derive the same judgement.

For syntax, this is a big problem, as different interpretations of syntax can lead to semantic inconsistency:

	$2\in\mathbb{Z}$	$3\in\mathbb{Z}$	$1\in\mathbb{Z}$	$2\in\mathbb{Z}$	
$1\in\mathbb{Z}$	2 Arith	3 Arith	1 Arith	2 Arith	$3\in\mathbb{Z}$
1 Arith	rith $2 \times 3$ Arith		1+2 <b>Arith</b>		3 Arith
$1+2 \times 3$ Arith		1 -	+ 2 × 3 <b>Ar</b>	ith	

Rule Induction

Ambiguity

Simultaneous Induction

# **Second Attempt**

We want to specify **Arith** in such a way that enforces order of operations.

Here we will use multiple judgements:

Example (Arithmetic	c Expression	n)			
$\begin{array}{llllllllllllllllllllllllllllllllllll$					
	a SExp (a) Atom		$e \mathbf{PExp}$		
a PExp	b PExp	a SExp	b SExp		
$a \times b$	PExp	a+b	SExp		

Consider: Is there still any ambiguity here?

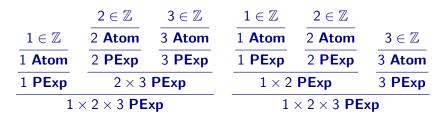

Rule Induction

Ambiguity

Simultaneous Induction

## More ambiguity

This ambiguity seems harmless, but it would not be harmless for some other operations. Which ones? Operators that are not *associative*.

We have to specify the *associativity* of operators. How?

Rule Induction

Ambiguity

Simultaneous Induction

### Associativities

Operators have various *associativity* constraints:

AssociativeAll associativities are equal.Left-Associative $A \odot B \odot C = (A \odot B) \odot C$ Right-Associative $A \odot B \odot C = A \odot (B \odot C)$ 

Try to think of some examples!

Rule Induction

Ambiguity

Simultaneous Induction

# **Enforcing associativity**

We force the grammar to accept a smaller set of expressions on one side of the operator only. Show how this works on the "whiteboard".

Example (Arithmetic Expression)				
PExp	::= i   (S ::= Atom ::= PExp	n   Atom ×	PExp	
$i\in\mathbb{Z}$	a SExp	e Atom	e <b>PExp</b>	
i Atom	(a) Atom	e PExp	e SExp	
a Atom	b PExp	a PExp	b SExp	
$a \times b$	PExp	a+b	SExp	

Here we made multiplication and addition right associative. How would we do left?

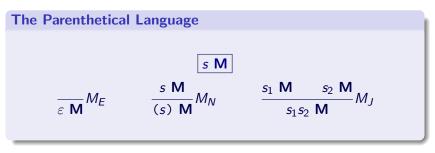

Rule Induction

Ambiguity

Simultaneous Induction

# **Bring Back Parentheses**

Is this language ambiguous? to "whiteboard"

Admin 0 Natural Deduction

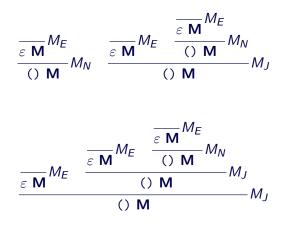

Rule Induction

Ambiguity

Simultaneous Induction

# **Ambiguity in Parentheses**

Not only is it ambiguous, it is infinitely so. Strings like ()()() could be split at two different locations by rule  $M_J$ , but if we use  $\varepsilon$ , then even the string () is ambiguous:

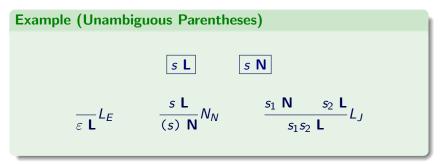

Rule Induction

Ambiguity

Simultaneous Induction

We will eliminate the ambiguity by once again splitting  ${\bf M}$  into two judgements,  ${\bf N}$  and  ${\bf L}.$ 

The crucial observation is that terms in M are a list  $(\mathsf{L})$  of terms nested within parentheses  $(\mathsf{N}).$ 

Ambiguity

Simultaneous Induction

# **Proving Equivalence**

Now we shall prove  $\mathbf{M} = \mathbf{L}$ . There are two cases, each dispatched with rule induction:

 $\frac{s \mathbf{M}}{s \mathbf{L}} = \frac{s \mathbf{L}}{s \mathbf{M}}$ 

The first case requires proving a *lemma*. The second requires *simultaneous induction*.

These proofs will be carried out on the "board".
