### File Management

Tanenbaum, Chapter 4

COMP3231 **Operating Systems** 

Leonid Ryzhyk Kevin Elphinstone

#### Outline

- Files and directories from the programmer (and user) perspective
- · Files and directory internals the operating system perspective

2

# Summary of the FS abstraction

User's view

#### Under the hood

Uniform namespace

Heterogeneous collection of storage devices

Hierarchical structure

Flat address space

Arbitrarily-sized files

Fixed-size blocks

Symbolic file names

Numeric block addresses

Contiguous address space inside Fragmentation a file

Access control

No access control

- Tools for
  formatting
  defragmentation
  backup
  consistency checking

THE UNIVERSITY OF NEW SOUTH WALES

## A brief history of file systems

- Early batch processing systems
  - No OS
  - \_ I/O from/to punch cards
  - Tapes and drums for external storage, but no FS
  - Rudimentary library support for reading/writing tapes and drums

IBM 709 [1958]

# A brief history of file systems

- · The first file systems were single-level (everything in one directory)
- · Files were stored in contiguous chunks
  - Maximal file size must be known in advance
- Now you can edit a program and save it in a named file on the tape!

PDP-8 with DECTape [1965]

3

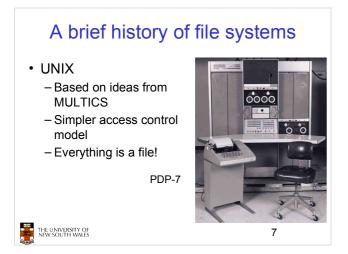

# A brief history of file systems

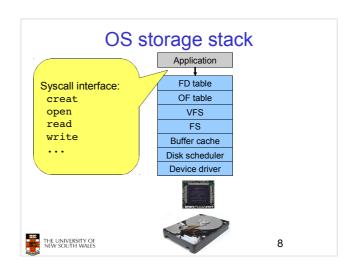

- Time-sharing OSs
  - Required full-fledged file systems
- MULTICS
  - Multilevel directory structure (keep files that belong to different users separately)
  - Access control lists
  - Symbolic links

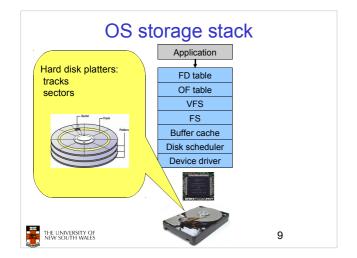

Honeywell 6180 running **MULTICS** [1976]

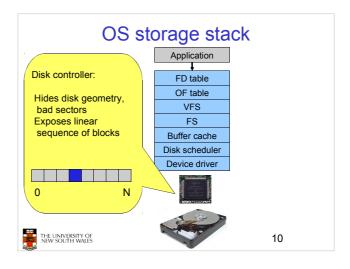

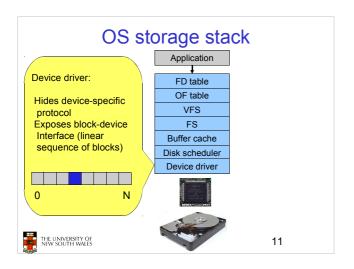

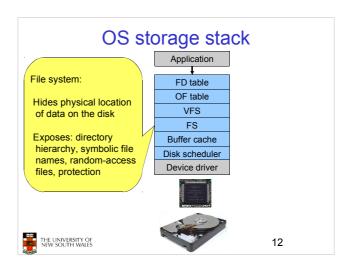

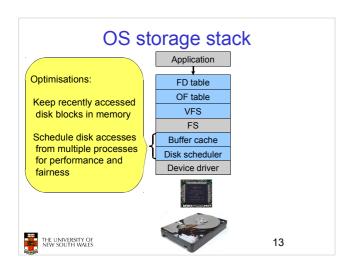

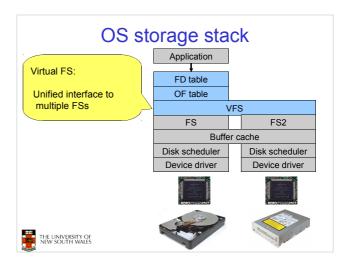

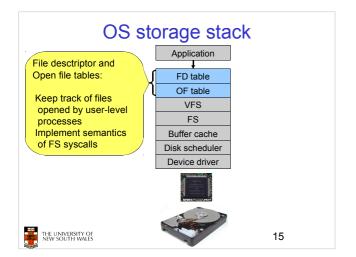

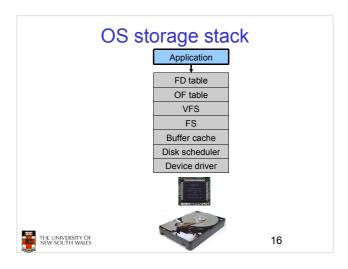

#### **File Names**

- · File system must provide a convenient naming scheme
  - Textual Names
  - May have restrictions
    - Only certain characters
      - E.g. no '/' characters
    - Limited length
    - · Only certain format
      - E.g DOS, 8 + 3
  - Case (in)sensitive
  - Names may obey conventions (.c files or C files)
    - Interpreted by tools (UNIX)
    - · Interpreted by operating system (Windows)

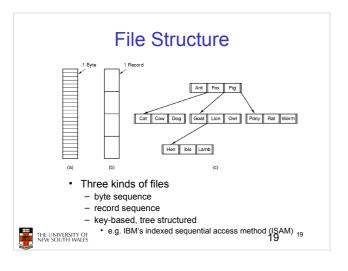

17

## File Naming

Extension	Meaning
file.bak	Backup file
file.c	C source program
file.gif	Compuserve Graphical Interchange Format image
file.hlp	Help file
file.html	World Wide Web HyperText Markup Language document
file.jpg	Still picture encoded with the JPEG standard
file.mp3	Music encoded in MPEG layer 3 audio format
file.mpg	Movie encoded with the MPEG standard
file.o	Object file (compiler output, not yet linked)
file.pdf	Portable Document Format file
file.ps	PostScript file
file.tex	Input for the TEX formatting program
file.txt	General text file
file.zip	Compressed archive

Typical file extensions.

#### File Structure

- · Stream of Bytes
  - OS considers a file to be unstructured
  - Simplifies file management for the OS
  - Applications can impose their own structure
  - Used by UNIX, Windows, most modern OSes

THE UNIVERSITY OF NEW SOUTH WALES

- · Records
  - Collection of bytes treated as a unit
    - Example: employee record
  - Operations at the level of records (read\_rec, write\_rec)
  - File is a collection of similar records
  - OS can optimise operations on records

20

#### File Structure

- · Tree of Records
  - Records of variable length
  - Each has an associated key
  - Record retrieval based on key
  - Used on some data processing systems (mainframes)
    - · Mostly incorporated into modern databases

21 21

# File Types

- · Regular files
- · Directories
- Device Files
  - May be divided into
    - Character Devices stream of bytes
    - Block Devices
- Some systems distinguish between regular file types
  - ASCII text files, binary files
- At minimum, all systems recognise their own executable file format
  - May use a magic number

22

22

# File Access Types

- · Sequential access
  - read all bytes/records from the beginning
  - cannot jump around, could rewind or back up
  - convenient when medium was mag tape
- · Random access
  - bytes/records read in any order
  - essential for data base systems
  - read can be ...
    - move file pointer (seek), then read or
      - Iseek(location,...);read(...)
    - · each read specifies the file pointer

- read(location,...)

THE UNIVERSITY OF NEW SOUTH WALES

23

23

## File Attributes

Attribute	Meaning
Protection	Who can access the file and in what way
Password	Password needed to access the file
Creator	ID of the person who created the file
Owner	Current owner
Read-only flag	0 for read/write; 1 for read only
Hidden flag	0 for normal; 1 for do not display in listings
System flag	0 for normal files; 1 for system file
Archive flag	0 for has been backed up; 1 for needs to be backed up
ASCII/binary flag	0 for ASCII file; 1 for binary file
Random access flag	0 for sequential access only; 1 for random access
Temporary flag	0 for normal; 1 for delete file on process exit
Lock flags	0 for unlocked; nonzero for locked
Record length	Number of bytes in a record
Key position	Offset of the key within each record
Key length	Number of bytes in the key field
Creation time	Date and time the file was created
Time of last access	Date and time the file was last accessed
Time of last change	Date and time the file has last changed
Current size	Number of bytes in the file
Maximum size	Number of bytes the file may grow to

Possible file attributes

## **Typical File Operations**

- 1. Create
- 1. Append
- 2. Delete
- 2. Seek
- 3. Open
- 3. Get
- 4. Close
- attributes
- 5. Read
- 4. Set
- 6. Write
- Attributes
- 5. Rename

25

```
An Example Program Using File System Calls
                                                    (1/2)
        /\star File copy program. Error checking and reporting is minimal. \star/
                                                              /* include necessary header files */
         #include <stdlib.h>
         #include <unistd.h>
        int main(int argc, char *argv[]);
                                                             /* ANSI prototype */
        #define BUF_SIZE 4096
#define OUTPUT_MODE 0700
                                                              /* use a buffer size of 4096 bytes */
/* protection bits for output file */
         int main(int argc, char *argv[])
              int in_fd, out_fd, rd_count, wt_count; char buffer[BUF_SIZE];
              if (argc != 3) exit(1);
                                                              /* syntax error if argc is not 3 */
              /* Open the input file and create the output file */ in_fd = open(argv[1], O_RDONLY); /* open the source file */ if (in_fd < 0) exit(2); /* if it cannot be opened, exit */
                                                                                                          26
```

#### int in\_ra, out\_ra, ra\_count, wt\_count; char buffer[BUF\_SIZE]; An E alls if (argc != 3) exit(1); /\* syntax error if argc is not 3 \*/ out\_fd = creat(argv[2], OUTPUT\_MODE); /\* create the destination file \*/ if (out\_fd < 0) exit(3); /\* if it cannot be created, exit \*/ /\* Close the files \*/ close(out fd) /\* no error on last read \*/ exit(5); /\* error on last read \*/ THE UNIVERSITY OF NEW SOUTH WALES 27

### File Organisation and Access Programmer's Perspective

· Given an operating system supporting unstructured files that are a stream-of-bytes,

how can one organise the contents of the files?

## File Organisation and Access Programmer's Perspective

- Performance considerations:
  - File system performance affects overall system performance
  - Organisation of the file system on disk affects performance
  - File organisation (data layout inside file) affects performance
    - · indirectly determines access patterns

- · Possible access patterns:
  - Read the whole file
  - Read individual blocks or records from a file
  - Read blocks or records preceding or following the current one
  - Retrieve a set of records
  - Write a whole file sequentially
  - Insert/delete/update records in a file
  - Update blocks in a file

29

## Classic File Organisations

- · There are many ways to organise a file's contents, here are just a few basic methods
  - Unstructured Stream (Pile)
  - Sequential Records
  - Indexed Sequential Records
  - Direct or Hashed Records

30

## Criteria for File Organization

Things to consider when designing file layout

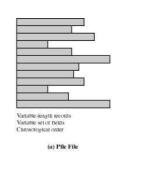

- Rapid access
  - Needed when accessing a single record
  - Not needed for batch mode
    - read from start to finish
- Ease of update
  - File on CD-ROM will not be updated, so this is not a concern
- Economy of storage
  - Should be minimum redundancy in the data
  - Redundancy can be used to speed access such as an index
- Simple maintenance
- Reliability

31

### **Unstructured Stream**

- · Data are collected in the order they arrive
- Purpose is to accumulate a mass of data and save it
- Records may have different fields
- No structure
- Record access is by exhaustive search

THE UNIVERSITY OF NEW SOUTH WALES

Figure 12.3 Common File Organizations

### **Unstructured Stream Performance**

- Update
  - Same size record okay
  - Variable size poor
- Retrieval

THE UNIVERSITY OF NEW SOUTH WALES

- Single record poor
- Subset poor
- Exhaustive okay

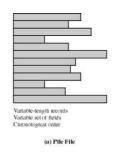

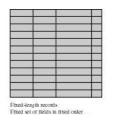

Figure 12.3 Common File Organizations

### The Sequential File

- Fixed format used for records
- Records are the same length
- Field names and lengths are attributes of the file
- One field is the key field
  - Uniquely identifies the record
  - Records are stored in key sequence

THE UNIVERSITY OF NEW SOUTH WALES

Figure 12.3 Common File Organizations

## The Sequential File

- Update
  - Same size record good
  - Variable size No
- Retrieval
  - Single record poor
  - Subset poor
  - Exhaustive okay

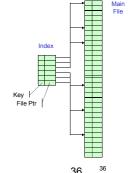

THE UNIVERSITY OF NEW SOUTH WALES

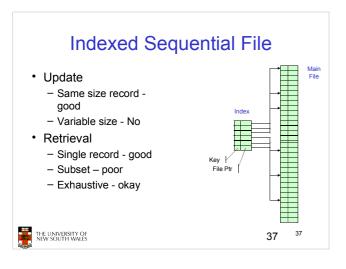

Figure 12.3 Common File Organizations

## **Indexed Sequential File**

- · Index provides a lookup capability to quickly reach the vicinity of the desired record
  - Contains key field and a pointer to (location in) the main file
  - Indexed is searched to find highest key value that is equal or less than the desired key
  - Search continues in the main file at the location indicated by the

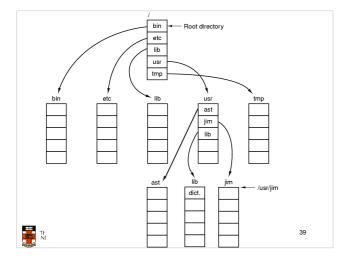

#### File Directories

- · Contains information about files
  - Attributes
  - Location
  - Ownership
- Directory itself is a file owned by the operating system
- Provides mapping between file names and the files themselves

38

# Hierarchical, or Tree-Structured Directory

- Files can be located by following a path from the root, or master, directory down various branches
  - This is the absolute pathname for the file
- Can have several files with the same file name as long as they have unique path names

## **Current Working Directory**

- Always specifying the absolute pathname for a file is tedious!
- Introduce the idea of a working directory
  - Files are referenced relative to the working directory
- Example: cwd = /home/leonid .profile = /home/leonid/.profile

# Relative and Absolute Pathnames

- Absolute pathname
- A path specified from the root of the file system to the file
- A Relative pathname
  - A pathname specified from the cwd
- Note: '.' (dot) and '..' (dotdot) refer to current and parent directory

Example: cwd = /home/leonid

../../etc/passwd

/etc/passwd

../leonid/../.././etc/passwd

Are all the same file

### **Typical Directory Operations**

- 1. Create
- 1. Readdir
- 2. Delete
- 2. Rename
- 3. Opendir
- 3. Link
- 4. Closedir
- 4. Unlink

43 4

### Nice properties of UNIX naming

- · Simple, regular format
  - Names referring to different servers, objects, etc., have the same syntax.
    - Regular tools can be used where specialised tools would be otherwise be needed.
- · Location independent
  - Objects can be distributed or migrated, and continue with the same names.

44 '

# An example of a bad naming convention

 From, Rob Pike and Peter Weinberger, "The Hideous Name", Bell Labs TR

UCBVAX::SYS\$DISK:[ROB.BIN]CAT V.EXE;13

45 <sup>45</sup>

## File Sharing

- In multiuser system, allow files to be shared among users
- · Two issues
  - Access rights
  - Management of simultaneous access

46

#### .

# Access Rights

- None
  - User may not know of the existence of the file
  - User is not allowed to read the user directory that includes the file
- Knowledge
  - User can only determine that the file exists and who its owner is

47 4

# • Execution

The user can load and execute a program but cannot copy it

**Access Rights** 

- Reading
  - The user can read the file for any purpose, including copying and execution
- Appending
  - The user can add data to the file but cannot modify or delete any of the file's contents

### **Access Rights**

- Updating
  - The user can modify, deleted, and add to the file's data. This includes creating the file, rewriting it, and removing all or part of the
- Changing protection
  - User can change access rights granted to other users
- Deletion
  - User can delete the file

49

#### **Access Rights**

- Owners
  - Has all rights previously listed
  - May grant rights to others using the following classes of users
    - · Specific user
    - · User groups
    - · All for public files

50

#### Case Study: **UNIX Access Permissions**

```
total 1704

```

- Execute permission for directory?
  - Permission to access files in the directory
- · To list a directory requires read permissions
- What about drwxr-x-x?

### **UNIX Access Permissions**

- Shortcoming
  - The three user categories a rather coarse
- · Problematic example
  - Joe owns file foo.bar
  - Joe wishes to keep his file private
    - · Inaccessible to the general public
  - Joe wishes to give Bill read and write access
  - Joe wishes to give Peter read-only access
  - How???????

## Simultaneous Access

- Most OSes provide mechanisms for users to manage concurrent access to files
  - Example: lockf(), flock() system calls
- Typically
  - User may lock entire file when it is to be updated
  - User may lock the individual records during the update
- Mutual exclusion and deadlock are issues for shared access
