

Learning Outcomes

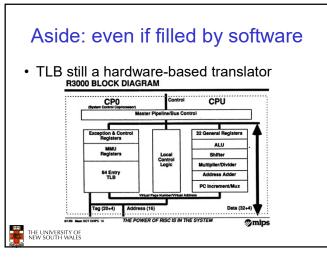

- An understanding of TLB refill:
 - in general,
 - and as implemented on the R3000
- An understanding of demand-paged virtual memory in depth, including:

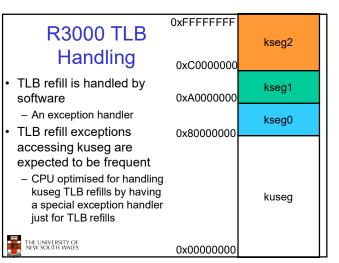

2

- Locality and working sets
- Page replacement algorithms
- Thrashing

(a) State of buffer fust prior to a page replacement Figure 8.16 Example of Clock Policy Operation

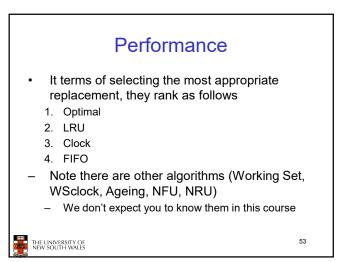

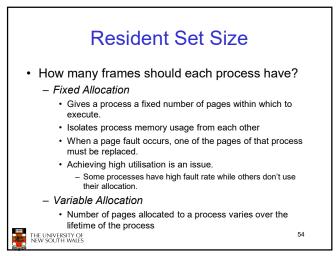

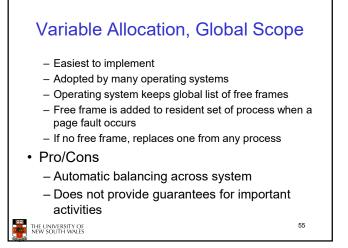

Variable Allocation, Local Scope

- Allocate number of page frames to a new process based on
 - Application type
 - Program request
 - Other criteria (priority)
- When a page fault occurs, select a page from among the resident set of the process that suffers the page fault

56

• Re-evaluate allocation from time to time!
