NICTA Advanced Course

Advanced Topics in Software Verification

Toby Murray, June Andronick, Gerwin Klein

Isar

Slide 1

Content

[a] a1 due; [b] a2 due; [c] a3 due

Slide 2

ISAR

A LANGUAGE FOR STRUCTURED PROOFS

Slide 3

Motivation

Is this true: $(A \longrightarrow B) = (B \vee \neg A)$?

Slide 4

Motivation

Is this true: $(A \longrightarrow B) = (B \vee \neg A)$?

YES!

```
apply (rule iffI)
 apply (cases A)
  apply (rule disjI1)
  apply (erule impE)
   apply assumption
  apply assumption
 apply (rule disjI2)
 apply assumption
apply (rule impI)
apply (erule disjE)
 apply assumption
apply (erule notE)
apply assumption
done
```

or `by blast`

OK it's true. But WHY?

Slide 5

Motivation

WHY is this true: $(A \longrightarrow B) = (B \vee \neg A)$?

Demo

Slide 6

Isar

apply scripts	**What about..**
➜ unreadable	➜ Elegance?
➜ hard to maintain	➜ Explaining deeper insights?
➜ do not scale	➜ Large developments?

No structure. **Isar!**

Slide 7

A typical Isar proof

proof
  assume $formula_0$
  have $formula_1$ **by** simp
  ⋮
  have $formula_n$ **by** blast
  show $formula_{n+1}$ **by** ...
qed

proves $formula_0 \Longrightarrow formula_{n+1}$

(analogous to **assumes**/**shows** in lemma statements)

Slide 8

Isar core syntax

proof = **proof** [method] statement* **qed**
| **by** method

method = (simp . . .) | (blast . . .) | (rule . . .) | . . .

statement = **fix** variables (⋀)
| **assume** proposition (⟹)
| [**from** name+] (**have** | **show**) proposition proof
| **next** (separates subgoals)

proposition = [name:] formula

Slide 9

proof and qed

proof [method] statement* **qed**

lemma "$[\![A; B]\!] \Longrightarrow A \wedge B$"
proof (rule conjI)
  assume A: "A"
  from A **show** "A" **by** assumption
next
  assume B: "B"
  from B **show** "B" **by** assumption
qed

- ➜ **proof** (<method>) applies method to the stated goal
- ➜ **proof** applies a single rule that fits
- ➜ **proof -** does nothing to the goal

Slide 10

How do I know what to Assume and Show?

Look at the proof state!

lemma "$[\![A; B]\!] \Longrightarrow A \wedge B$"
proof (rule conjI)

- ➜ **proof** (rule conjI) changes proof state to
  1. $[\![A; B]\!] \Longrightarrow A$
  2. $[\![A; B]\!] \Longrightarrow B$
- ➜ so we need 2 shows: **show** "A" and **show** "B"
- ➜ We are allowed to **assume** A,
  because A is in the assumptions of the proof state.

Slide 11

The Three Modes of Isar

- ➜ **[prove]**:
  goal has been stated, proof needs to follow.
- ➜ **[state]**:
  proof block has openend or subgoal has been proved,
  new *from* statement, goal statement or assumptions can follow.
- ➜ **[chain]**:
  from statement has been made, goal statement needs to follow.

lemma "$[\![A; B]\!] \Longrightarrow A \wedge B$" **[prove]**
proof (rule conjI) **[state]**
  assume A: "A" **[state]**
  from A **[chain]** **show** "A" **[prove]** **by** assumption **[state]**
next **[state]** **. . .**

Slide 12

Have

Can be used to make intermediate steps.

Example:

lemma "$(x :: \mathsf{nat}) + 1 = 1 + x$"
proof -
  have A: "$x + 1 = \mathsf{Suc}\ x$" **by** simp
  have B: "$1 + x = \mathsf{Suc}\ x$" **by** simp
  show "$x + 1 = 1 + x$" **by** (simp only: A B)
qed

Slide 13

DEMO

Slide 14

Backward and Forward

Backward reasoning: ... **have** "$A \wedge B$" **proof**
- ➜ **proof** picks an **intro** rule automatically
- ➜ conclusion of rule must unify with $A \wedge B$

Forward reasoning: ...
assume AB: "$A \wedge B$"
from AB **have** "..." **proof**
- ➜ now **proof** picks an **elim** rule automatically
- ➜ triggered by **from**
- ➜ first assumption of rule must unify with AB

General case: from $A_1 \ldots A_n$ **have** R **proof**
- ➜ first n assumptions of rule must unify with $A_1 \ldots A_n$
- ➜ conclusion of rule must unify with R

Slide 15

Fix and Obtain

fix $v_1 \ldots v_n$

Introduces new arbitrary but fixed variables
(∼ parameters, ⋀)

obtain $v_1 \ldots v_n$ **where** <prop> <proof>

Introduces new variables together with property

Slide 16

DEMO

Slide 17

Fancy Abbreviations

this	=	the previous fact proved or assumed
then	=	**from** this
thus	=	**then show**
hence	=	**then have**
with $A_1 \dots A_n$	=	**from** $A_1 \dots A_n$ this
?thesis	=	the last enclosing goal statement

Slide 18

Moreover and Ultimately

have X_1: P_1 ...	**have** P_1 ...
have X_2: P_2 ...	**moreover have** P_2 ...
⋮	⋮
have X_n: P_n ...	**moreover have** P_n ...
from $X_1 \dots X_n$ **show** ...	**ultimately show** ...

wastes lots of brain power
on names $X_1 \dots X_n$

Slide 19

General Case Distinctions

show $formula$
proof -
  have $P_1 \vee P_2 \vee P_3$ <proof>
  moreover { **assume** P_1 ... **have** ?thesis <proof> }
  moreover { **assume** P_2 ... **have** ?thesis <proof> }
  moreover { **assume** P_3 ... **have** ?thesis <proof> }
  ultimately show ?thesis **by** blast
qed

{ ... } is a proof block similar to **proof** ... **qed**

{ **assume** P_1 ... **have** P <proof> }
stands for $P_1 \Longrightarrow P$

Slide 20

Mixing proof styles

from . . .
have . . .
  apply - make incoming facts assumptions
  apply (. . .)
  ⋮
  apply (. . .)
  done

Slide 21
