Multi-file C Programs

- Large C programs spread across many C files e.g. Linux operating system has 50,000+ .c files.
- Files provide a *de facto* module system in C.
- C functions can be called from any file, unless **static** Declaring functions **static**
 - avoids name clashes in huge programs
 - makes programs more readable/maintainable
- No checking of function parameters & return types between files
- By convention include **.h** files used to share information between **.c** files ensure types match between files.

- Include .h files contain:
 - function prototypes
 - type definitions
 - #define's
- .h files should not contain code (function definitions)
- #include with "" used to incorporate .h file put #include at top of .c file

Example: Include File

answer.h

```
int answer(double x);
```

answer.c

```
#include "answer.h"
int answer(double x) {
    return x * 21;
}
```

main.c

```
#include "answer.h"
int main(void) {
    printf("answer(2) = %d\n", answer(1));
    return 0;
}
```

```
$ dcc main.c answer.c -o answer
$ ./answer
42
```

Can also compile file separately creating bf .o files which contain machine code for one file.

```
$ dcc -c main.c
$ dcc -c answer.c
$ dcc main.o answer.o -o answer
$ ./answer
42
```

Useful with huge programs because faster to re-compile only part changed since last compilation.
